Overview

The sample set for NAS Jacksonville, CTO 047, SDG BR006-014, consists of sixteen (16) aqueous environmental samples. No field duplicate pairs were included in this SDG.

All samples were analyzed for arsenic. Samples JAX47-MW14S-120806, JAX47-MW28S-120806 and JAX47-937MW4S-120106 were also analyzed for dissolved arsenic. The samples were collected by Tetra Tech NUS, Inc. on December 1, 5 and 8, 2006 and analyzed by Environmental Conservation Laboratories, Inc. Arsenic analyses were conducted using EPA methods 3010A and 6010 methodologies.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Recoveries
* • Laboratory Method/Preparation Blank Analyses
* • ICP Interference Check Sample Results
* • Matrix Spike / Matrix Spike Duplicate Recoveries
* • Laboratory Control Sample Recoveries
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Notes

It was noted in the case narrative that for sample JAX47-937MW4S-120106 the dissolved arsenic result was higher than the total arsenic result. The laboratory re-prepared and reanalyzed the sample producing the same results. The original results are reported within this SDG.

The laboratory included the characters "937" in three samples that did not agree with the Chain of Custody (COC) record. The sample ids were changed by the data reviewer on the affected Form Is and the database was amended. The samples were summarized in the laboratory case narrative.

Executive Summary

Laboratory Performance: Several samples were misnamed by the laboratory.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Review", October 2004.

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Appendix A
Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Appendix C
Support Documentation

Volatiles

Method: The samples were analyzed by USEPA Method 8260B (VOA vial field sampling followed by purge and trap then capillary column GC/MS) for waters upon receipt to the laboratory in satisfactory condition.
Comments: The volatile analyses for these samples were satisfactorily completed within sample holding times and met the corresponding specifications with the following note/exceptions:

- The Matrix Spike and Matrix Spike Duplicate had several compounds that were outside the DoD QSM control limits. Data was accepted based on an acceptable Laboratory Control Standard and precision data.
- Laboratory Control Standard was outside the DoD QSM control limits for Bromodichloromethane but was within the DoD QSM marginal exceedance limits.
- Several compounds did not meet the specified control limits for the Continuing Calibration Check Standard. Data was accepted on criteria that all CCC and SPCC compounds passed.

Metals

Method: The samples were extracted by USEPA Method 3050 and analyzed by EPA Method 6010 for soils upon receipt to the laboratory in satisfactory condition.
Comments: The analyses for these samples were satisfactorily completed within sample holding times and met the corresponding specifications with the following note/exceptions:

- The dissolved Arsenic result for JAX47-937MW4S-120106 was higher than the total Arsenic result. Sample was re-prepped and re-analyzed producing similar results. Both sets of data were reported.

CASE NARRATIVE

SUBJECT:	**ORGANIC DATA VALIDATION- VOC, SVOC, PEST** **CTO 047, NAS JACKSONVILLE** **SDG BR006-020**		
SAMPLES:	1/Aqueous		

JAX47-MW29S-030907 JAX47-MW30S-030907 JAX47-MW31D-030709

OVERVIEW

The sample set for CTO 047 NAS Jacksonville, SDG BR006-020 consists of three (3) aqueous environmental samples. All samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOC), semivolatile organic compounds (SVOC) and, pesticide (PEST) organic compounds.

The samples were collected by TetraTech NUS on March 9, 2007 and analyzed by Environmental Conservation Laboratories, Inc. Analyses were conducted in accordance with SW-846 Methods 8260B, 8270C, and 8081A analysis and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

*	• Data completeness
*	• Holding times
*	• GC/MS Tuning
	• Initial/continuing calibrations
	• Laboratory method blank results
*	• Surrogate Recoveries
	• Blank Spike/Blank Spike Duplicate Results
	• Matrix Spike/Matrix Spike Duplicate Results
*	• Compound Quantitation
	• Compound Identification
*	• Detection Limits

The symbol (*) indicates that quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A.

VOC

The following compound was detected in the method blank:

Compound	Maximum Concentration	Blank Action Level
Carbon disulfide	1.59 ug/L	7.95 ug/L
Toluene	0.23 ug/L	1.15 ug/kg
Total xylenes	0.41 ug/L	2.05 ug/kg

An action level of 5X the maximum contaminant concentration was established to evaluate laboratory contamination for the aforementioned compounds. Dilution factors and sample aliquots were taken into consideration during the application of the action level. The positive result for total xylenes was qualified (U) as a blank contaminant in sample JAX47-MW29S-030907. The positive results for toluene and total xylenes were qualified (U) as blank contaminants in samples JAX47-MW30S-030907 and JAX47-MW31D-030907

The matrix spike / matrix spike duplicate (MS/MSD) performed on sample JAX47-MW31D-0300709 had percent recoveries below the quality control limit for bromomethane in the MS / MSD. Bromomethane was not detected in the associated LCS. The laboratory reported a problem with detecting this compound in the entire batch run. The bromomethane results for all samples have been rejected (UR).

Continuing calibration percent difference (%D) was greater than the 25% quality control limit for bromomethane on instrument JSVGCMS2 on 3/23/07. Only non-detected results were reported for the aforementioned compound and these were previously rejected because of a more severe problem.

PEST

The following compound was detected in the method blank:

Compound	Maximum Concentration	Blank Action Level
Delta-BHC	0.061 ug/L	0.305 ug/L

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. The method blank was reported on a wet weight basis. The positive delta-BHC results in samples JAX47-MW29S-030907 and JAX47-MW30S-030907 below the blank action level were qualified as non-detected, (U).

The percent difference (%D) between analytical columns for the pesticide analyses exceeded 25% for positive results reported for several compounds in the following samples and the results have been qualified as estimated, "J":

Sample Number	Compound	% Difference	Qualification
JAX47-MW29S-030907	Heptachlor	46.2%	J
	Dieldrin	58.1%	J

SVOC

Continuing calibration percent differences (%Ds) were greater than the 25% quality control limit for 2,4-dinitrophenol, 2-methyl-4,6-dinitrophenol, and 4-nitroaniline chloride on instrument JSVGCMS1 on 3/22/07. Only non-detected results were reported for the aforementioned compounds and these were qualified as estimated (UJ), in the affected samples.

The Form VI and VII submitted with this package were incomplete. The laboratory was contacted and resubmitted corrected forms.

MS/MSD performed on sample JAX47-MW31D-030907 had percent recoveries greater than the quality control limit for 2-methyl-4,6-dinitrophenol, fluroanthene, benzo(a)anthracene, chrysene, and benzo(a)pyrene in the MS and N-nitrosodiphenylamine in the MS/MSD. No action was taken on this basis because these compounds were not detected in the associated sample.

The laboratory control sample (LCS) had a percent recovery greater than the quality control limit for N-nitrosodiphenylamine. No action was taken on this basis because N-nitrosodiphenylamine was not detected in the associated samples.

Positive results less than the reporting limit (RL) were qualified as estimated "J", due to uncertainty near the detection limit.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Several compounds were detected in the method blanks for the VOC and PEST fractions. Several compounds for the VOC and SVOC exceeded the continuing calibration %D criteria resulting in qualification of the data. Bromomethane was not detected in a VOC LCS resulting in rejection of the data for all samples. Several SVOC compounds were not analyzed by the laboratory in the initial and/or continuing calibrations.

Other Factors Affecting Data Quality: Several recovery non-compliances were noted for the MS/MSDs for the VOC and SVOC fractions. Percent difference between columns for the PEST fraction exceeded criteria for several compounds resulting in qualification of the data.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (October 1999), and Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the DoD QSM."

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$ / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

CASE NARRATIVE

Tetra Tech NUS, Inc / NAS Jacksonville, CTO 047

Project Manger Mark Peterson

SDG BR006-020

Lab Sample ID	Client Sample ID
B702192-01	JAX47-MW29S-030907
B702192-02	JAX47-MW30S-030907
B702192-03	JAX47-MW31D-030907

Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were analyzed by SW846 Method 8260B.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Xylenes and Toluene were detected in the method blank, JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907 at a concentration above the Method Detection Limit but below the Method Reporting Limit. The sample results for these compounds at or below the MRL should be considered estimated.

- Matrix Spike, Matrix Spike Duplicate and Laboratory Control Standard was outside the (below) DoD QSM control limits for Bromomethane. This appears to be a random problem that illustrates an instrument problem during this particular analysis run. This appears to be a coelution of water with Bromomethane at that retention time. System maintenance did not correct this problem however it is being actively addressed.

Metals

Method: The samples were extracted by USEPA Method 3050 and analyzed by EPA Method 6010.
Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications.

Semi-Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8081c.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following note/exceptions:

- Low level positive recovery for Delta-BHC was detected in the laboratory method blank JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907. Sample results for this compound should be considered estimated.

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8270c.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Matrix Spike and Matrix Spike Duplicate were outside (above) the DoD QSM control limits for 2-methyl-4,6 dinitrophenol, n-nitrosodiphenylamine, fluoranthene, benzo(a)anthracene, chrysene and benzo(a) pyrene. Samples within this batch were non-detect for those specific compounds.

- Laboratory Control Standard was outside (above) the DoD QSM control limits for n-nitrosodiphenylamine. Samples within this batch were non-detect for this compound.

- Continuing Calibration Check Standard for 2-Methyl-4,6 dintrophenol was outside (above) the DoD QSM control limits. There was no detectible compound in the samples following this continuing calibration check.

- Initial Calibration Standard was above DoD QSM control limits for 2-methylphenol, benzidine, Bis(2-ethylhexyl) phthalate. Samples were clean for those compounds and accepted.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Overview

The sample set for CTO 047, NAS Jacksonville, SDG BR006-020, consists of three (3) aqueous environmental samples. No field duplicate pairs are included within this SDG.

All samples were analyzed for arsenic. The samples were collected by Tetra Tech NUS on March 9, 2007 and analyzed by Environmental Conservation Laboratories, Inc under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Arsenic analyses were conducted using SW-846 method 6010.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) instrumentation.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Verification Results
* • Laboratory Method/Preparation Blank Analyses
* • ICP Interference Check Sample Results
* • Matrix Spike/Matrix Spike Duplicate Results
* • Laboratory Control Sample/ Laboratory Control Sample Duplicate Results
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Notes

None.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", October 2004 and the DOD document entitled "Quality System Manual (QSM) for Environmental Laboratories" (January 2006).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the DOD QSM and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS-GFAA MSA's r < 0.995 / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O - Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DOT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

APPENDIX C
SUPPORT DOCUMENTATION

Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were analyzed by SW846 Method 8260B.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Xylenes and Toluene were detected in the method blank, JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907 at a concentration above the Method Detection Limit but below the Method Reporting Limit. The sample results for these compounds at or below the MRL should be considered estimated.

- Matrix Spike, Matrix Spike Duplicate and Laboratory Control Standard was outside the (below) DoD QSM control limits for Bromomethane. This appears to be a random problem that illustrates an instrument problem during this particular analysis run. This appears to be a coelution of water with Bromomethane at that retention time. System maintenance did not correct this problem however it is being actively addressed.

Metals

Method: The samples were extracted by USEPA Method 3050 and analyzed by EPA Method 6010.
Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications.

Semi-Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8081c.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following note/exceptions:

- Low level positive recovery for Delta-BHC was detected in the laboratory method blank JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907. Sample results for this compound should be considered estimated.

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8270c.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Matrix Spike and Matrix Spike Duplicate were outside (above) the DoD QSM control limits for 2-methyl-4,6 dinitrophenol, n-nitrosodiphenylamine, fluoranthene, benzo(a)anthracene, chrysene and benzo(a) pyrene. Samples within this batch were non-detect for those specific compounds.

- Laboratory Control Standard was outside (above) the DoD QSM control limits for n-nitrosodiphenylamine. Samples within this batch were non-detect for this compound.

- Continuing Calibration Check Standard for 2-Methyl-4,6 dintrophenol was outside (above) the DoD QSM control limits. There was no detectible compound in the samples following this continuing calibration check.

- Initial Calibration Standard was above DoD QSM control limits for 2-methylphenol, benzidine, Bis(2-ethylhexyl) phthalate. Samples were clean for those compounds and accepted.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

CTO 047, NAS JACKSONVILLE
SDG BR006-021

SAMPLES: 1/Aqueous

TB01

3/Solid

JAX47-SB118-01-03 07 JAX47-SB118-03-03 07 JAX47-SB120-01-030907

OVERVIEW

The sample set for CTO 047 NAS Jacksonville, SDG BR006-021 consists of one (1) trip blank and three (3) solid environmental samples. Samples JAX47-SB118-01-03 07 and JAX47-SB118-03-03 07 were analyzed for Target Compound List (TCL) volatile organic compounds (VOC) and semivolatile organic compounds (SVOC). Samples JAX47-SB118-01-03 07, JAX47-SB118-03-03 07 and, JAX47-SB120-01-030907 were analyzed for pesticide (PEST) organic compounds. The trip blank was analyzed for VOCs only.

The samples were collected by TetraTech NUS on March 9 and 13, 2007 and analyzed by Environmental Conservation Laboratories, Inc. Analyses were conducted in accordance with SW-846 Methods 8260B, 8270C, and 8081A analysis and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

*	•	Data completeness
*	•	Holding times
*	•	GC/MS Tuning
	•	Initial/continuing calibrations
	•	Laboratory method blank results
*	•	Surrogate Recoveries
	•	Blank Spike/Blank Spike Duplicate Results
	•	Matrix Spike/Matrix Spike Duplicate Results
*	•	Compound Quantitation
	•	Compound Identification
*	•	Detection Limits

The symbol (*) indicates that quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A.

VOC

The following compound was detected in the method blank:

Compound	Maximum Concentration	Blank Action Level
Toluene	0.00066 mg/kg	0.0033 mg/kg

An action level of 5X the maximum contaminant concentration was established to evaluate laboratory contamination for toluene. Dilution factors, sample aliquots and percent solids were taken into consideration during the application of the action level. The positive result for toluene was qualified (U) as a blank contaminant in sample JAX47-SB118-01-03 07.

The method blank associated with the trip blank had detections for carbon disulfide, toluene, and total xylenes. The trip blank had a detection for total xylenes. No action was taken on this basis because trip blank samples are not qualified because of method blank contamination.

The matrix spike / matrix spike duplicate (MS/MSD) performed on sample JAX47-SB118-03-03 07 had percent recoveries below the quality control limit for 1,2-dibromoethane and 1,2-dichlorobenzene in the MS. In addition, methylene chloride had a relative percent difference outside of the quality control limit. No action was taken on this basis because either the MS or MSD had an acceptable recovery for every compound.

The LCS associated with the trip blank had a zero percent recovery for bromomethane. The laboratory reported a problem with detecting this compound in the entire batch run. The non-detected bromomethane result for the trip blank has been rejected "UR".

Initial calibration and continuing calibration relative response factors (RRFs) associated with the soil samples were less than the 0.05 quality control limit for 2-butanone and 4-methyl-2-pentanone on instrument JVGCMS1. Only non-detected results were reported for the aforementioned compounds and these were rejected (UR) in all soil samples.

Continuing calibration percent difference (%D) was greater than the 25% quality control limit for bromomethane on instrument JSVGCMS2 on 3/23/07. No action was taken on this basis because bromomethane was previously rejected for a more severe non-compliance in the trip blank.

Acetone and methylene chloride were not detected in any associated laboratory method blanks. However, they are suspected laboratory contaminants. The positive acetone and methylene chloride results for all soil samples have been qualified as estimated (J).

PEST

The following compound was detected in the method blank:

Compound	Maximum Concentration	Blank Action Level
Delta-BHC	0.0021 mg/kg	0.0105 mg/kg

Sample aliquot, percent solids, and dilution factors were taken into consideration when applying the blank action levels. The method blank was reported on a wet weight basis. The positive delta-BHC result in sample JAX47-SB118-01-03 07 below the blank action level was qualified as non-detected, (U).

The percent difference (%D) between analytical columns for the pesticide analyses exceeded 25% for positive results in the following samples and the results have been qualified as estimated, "J":

Sample Number	Compound	% Difference	Qualification
JAX47-SB118-01-03 07	Dieldrin	37.5%	J
JAX47-SB118-01-03 07	4,4'-DDE	160%	J
	4,4'-DDT	156%	J

SVOC

The surrogates 2-fluorophenol and phenol-d5 for sample JAX47-SB118-01-03 07 had percent recoveries greater than the quality control limit. No action was taken on this basis because only non-detected results were reported for sample JAX47-SB118-01-03 07.

The surrogate phenol-d5 for sample JAX47-SB118-03-03 07 had a percent recovery greater than the quality control limit. No action was taken on this basis because only one surrogate per fraction was outside of the control limit.

Continuing calibration percent differences (%Ds) were greater than the 25% quality control limit for 2,4-dinitrophenol, 2-methyl-4,6-dinitrophenol, and 4-nitroaniline chloride on instrument JSVGCMS1 on 3/22/07. Only non-detected results were reported for the aforementioned compounds and these were qualified as estimated (UJ), in the affected samples.

MS/MSD performed on sample JAX47-SB118-03-03 07 had percent recoveries greater than the quality control limit for N-nitrosodiphenylamine and 3,3'-dichlorobenzidine in the MS and MSD. In addition, 2,4-dinitrophenol had a relative percent difference (RPD) outside of the quality control limit. No action was taken on this basis because these compounds were not detected in the associated sample.

Positive results less than the reporting limit (RL) were qualified as estimated "J", due to uncertainty near the detection limit.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Several compounds were detected in the method blanks for the VOC and PEST fractions. Several compounds for the VOC and SVOC exceeded the continuing calibration %D or RRF criteria resulting in qualification of the data. Bromomethane was not detected in a VOC LCS resulting in rejection of the data for one sample.

Other Factors Affecting Data Quality: Several recovery non-compliances were noted for the MS/MSDs for the VOC and SVOC fractions. Surrogate recovelry non-compliances for the SVOC fraction resulted in qualification of the data. Percent difference between columns for the PEST fraction exceeded criteria for several compounds resulting in qualification of the data.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (October 1999), and Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the DoD QSM."

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$ / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Method: Samples were received into the laboratory in satisfactory condition. The samples were analyzed by SW846 Method 8260B.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Xylenes and Toluene were detected in the method blank, JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907 at a concentration above the Method Detection Limit but below the Method Reporting Limit. The sample results for these compounds at or below the MRL should be considered estimated.

- Matrix Spike, Matrix Spike Duplicate and Laboratory Control Standard was outside the (below) DoD QSM control limits for Bromomethane. This appears to be a random problem that illustrates an instrument problem during this particular analysis run. This appears to be a co-elution of water with Bromomethane at that retention time. System maintenance did not correct this problem however it is being actively addressed.

- Matrix Spike ID 7C22012-MS1 was outside the DoD QSM control limits for 1,2 Dibromoethane and 1,2 Dichlorobenzene. Reportable data was achieved from passing Laboratory Control Standard within the DoD QSM control limits.

- The percent RPD for the Matrix Spike and Matrix Spike Duplicate was outside the DoD QSM control limits for Methylene Chloride. Reportable data was achieved from passing Laboratory Control Standard within the DoD QSM control limits.

- Continuing Calibration Standard BA00467-CCV1 was outside (above) the DoD QSM control limits for 1,2,4-Trichlorobenzene. Samples did not have any positive results for this compound.

Metals

Method: The samples were extracted by USEPA Method 3050 and analyzed by EPA Method 6010.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- JAX47-SB116-01-030907 was analyzed at a 1:10 dilution due to calcium interference in the original run. The original data is included.

- The low concentration calibration verification standard BA00429-001 did not meet the DoD QSM control limits. Several samples were re-analyzed and reported under passing DoD QSM control limits. The sample ID's affected were JAX47-SB117-01-030907, JAX47-SB119-01-030907, JAX47-SB119-05-030907, JAX47-SB120-01-030907 and JAX47-SB121-01-030907.

- Samples were analyzed in two separate analytical batches resulting in the Matrix Spike and Matrix Spike Duplicate for batch 7C13002 being analyzed on an alternative sample not related to this project.

Semi-Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8081c.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following note/exceptions:

- Low level positive recovery for Delta-BHC was detected in the laboratory method blank and JAX47-SB118-01-0307. Sample results for this compound should be considered estimated.

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8270c.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Surrogate recovery for 2-Flurophenol and Phenol-5 on samples JAX47-SB118-01-0307 and JAX47-SB118-03-0307 were outside (above) DoD QSM control. Samples were clean and data was accepted.

- Matrix Spike and Matrix Spike Duplicate were outside (above) the DoD QSM control limits for n-nitrosodiphenylamine and 3,3 dichlorobenzidine. Samples within this batch were non-detect for those specific compounds.

- Continuing Calibration Check Standard for 2,4 dinitrophenol and 2-Methyl-4,6 dintrophenol was outside (above) the DoD QSM control limits. There was no detectible compound in the samples following this continuing calibration check.

- Initial Calibration Standard was above DoD QSM control limits for 2-methylphenol, pentachlorophenol, benzidine, Bis(2-ethylhexyl) phthalate. Samples were clean for those compounds and data was accepted.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Overview

The sample set for CTO 047, NAS Jacksonville, SDG BR006-021, consists of nine (9) soil environmental samples. No field duplicate pairs are included within this SDG.

All samples were analyzed for arsenic. The samples were collected by Tetra Tech NUS on March 9, 2007 and analyzed by Environmental Conservation Laboratories, Inc under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Arsenic analyses were conducted using SW-846 method 6010.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) instrumentation.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Verification Results
* • Laboratory Method/Preparation Blank Analyses
* • ICP Interference Check Sample Results
* • Matrix Spike/Matrix Spike Duplicate Results
* • Laboratory Control Sample/ Laboratory Control Sample Duplicate Results
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Notes

Sample JAX47-SB116-01-030907 was analyzed at a 10X dilution due to calcium interference according to the laboratory.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", October 2004 and the DOD document entitled "Quality System Manual (QSM) for Environmental Laboratories" (January 2006).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the DOD QSM and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS-GFAA MSA's r < 0.995 / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O - Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DOT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

APPENDIX C
SUPPORT DOCUMENTATION

Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were analyzed by SW846 Method 8260B.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Xylenes and Toluene were detected in the method blank, JAX47-MW29S-030907, JAX47-MW30S-030907 and JAX47-MW31D-030907 at a concentration above the Method Detection Limit but below the Method Reporting Limit. The sample results for these compounds at or below the MRL should be considered estimated.

- Matrix Spike, Matrix Spike Duplicate and Laboratory Control Standard was outside the (below) DoD QSM control limits for Bromomethane. This appears to be a random problem that illustrates an instrument problem during this particular analysis run. This appears to be a co-elution of water with Bromomethane at that retention time. System maintenance did not correct this problem however it is being actively addressed.

- Matrix Spike ID 7C22012-MS1 was outside the DoD QSM control limits for 1,2 Dibromoethane and 1,2 Dichlorobenzene. Reportable data was achieved from passing Laboratory Control Standard within the DoD QSM control limits.

- The percent RPD for the Matrix Spike and Matrix Spike Duplicate was outside the DoD QSM control limits for Methylene Chloride. Reportable data was achieved from passing Laboratory Control Standard within the DoD QSM control limits.

- Continuing Calibration Standard BA00467-CCV1 was outside (above) the DoD QSM control limits for 1,2,4-Trichlorobenzene. Samples did not have any positive results for this compound.

Metals

Method: The samples were extracted by USEPA Method 3050 and analyzed by EPA Method 6010.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- JAX47-SB116-01-030907 was analyzed at a 1:10 dilution due to calcium interference in the original run. The original data is included.

- The low concentration calibration verification standard BA00429-001 did not meet the DoD QSM control limits. Several samples were re-analyzed and reported under passing DoD QSM control limits. The sample ID's affected were JAX47-SB117-01-030907, JAX47-SB119-01-030907, JAX47-SB119-05-030907, JAX47-SB120-01-030907 and JAX47-SB121-01-030907.

- Samples were analyzed in two separate analytical batches resulting in the Matrix Spike and Matrix Spike Duplicate for batch 7C13002 being analyzed on an alternative sample not related to this project.

Semi-Volatiles

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8081c.

Comments: The analyses for these samples were satisfactorily completed within method holding time and met the corresponding specifications with the following note/exceptions:

- Low level positive recovery for Delta-BHC was detected in the laboratory method blank and JAX47-SB118-01-0307. Sample results for this compound should be considered estimated.

Method: Samples were received into the laboratory in satisfactory condition. The samples were extracted and analyzed by USEPA SW-846 Methods 3545/8270c.

Comments: The analyses for these samples were completed within method holding time and met the corresponding specifications with the following notes/exceptions:

- Surrogate recovery for 2-Flurophenol and Phenol-5 on samples JAX47-SB118-01-0307 and JAX47-SB118-03-0307 were outside (above) DoD QSM control. Samples were clean and data was accepted.
- Matrix Spike and Matrix Spike Duplicate were outside (above) the DoD QSM control limits for n-nitrosodiphenylamine and 3,3 dichlorobenzidine. Samples within this batch were non-detect for those specific compounds.
- Continuing Calibration Check Standard for 2,4 dinitrophenol and 2-Methyl-4,6 dintrophenol was outside (above) the DoD QSM control limits. There was no detectible compound in the samples following this continuing calibration check.
- Initial Calibration Standard was above DoD QSM control limits for 2-methylphenol, pentachlorophenol, benzidine, Bis(2-ethylhexyl) phthalate. Samples were clean for those compounds and data was accepted.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

CALCULATION WORKSHEET

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INCIDENTAL INGESTION OF SOIL FUTURE ON-SITE CHILD RESIDENT		
BASED ON: USEPA, DEC. 1989		
BY: R. JUPIN	**CHECKED BY:**	**DATE:** 04/20/07

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from incidental ingestion of surface/subsurface soil at PSC 47.

EQUATION:

$$IEX = \frac{CS \times IR \times EF \times ED \times FI \times CF}{BW \times AT}$$

Where:

IEX	=	estimated exposure intake (mg/kg/day)
Cs	=	exposure point concentration in soil/sediment (mg/kg)
IR	=	incidental soil ingestion rate (mg/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
FI	=	fraction ingested from contaminated source (unitless)
CF	=	conversion factor (1.0E-6 kg/mg)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFo	=	oral carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDo	=	oral noncarcinogenic reference dose (mg/kg/day)

RISKS:

ICLR (Carcinogens) = Intake (mg/kg/day) x CSFo $(mg/kg/day)^{-1}$

HQ (Noncarcinogens) = Intake (mg/kg/day) / RFDo (mg/kg/day)

ASSUMPTIONS:

Cs	=	0.4	mg/kg	Chemical: alpha-Chlordane
IR	=	200	mg/day	
EF	=	350	days/year	
ED	=	6	years	
FI	=	1		
CF	=	1.0E-06	kg/mg	
BW	=	15	kg	
ATc	=	25550	days	
ATnc	=	2190	days	
CSFo	=	3.5E-01	$(mg/kg/day)^{-1}$	
RfDo	=	5.0E-04	(mg/kg/day)	

CLIENT: NAS JACKSONVILLE, FLORIDA		JOB NUMBER: 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INCIDENTAL INGESTION OF SOIL FUTURE ON-SITE CHILD RESIDENT		
BASED ON: USEPA, DEC. 1989		
BY: R. JUPIN	CHECKED BY:	DATE: 04/20/07

EXAMPLE CARCINOGENIC CALCULATION

$$IEXc = \frac{0.4\ mg/kg \times 200\ mg/day \times 350\ days/year \times 6\ years \times 1.0E\text{-}06\ kg/mg}{15\ kg \times 25550\ days}$$

IEXc = 4.38E-07 mg/kg/day

ICLR = 4.38E-07 mg/kg/day x 3.50E-01 (mg/kg/day)-1 = Incremental Lifetime Cancer Risk

ICLR = 1.5E-07

EXAMPLE NONCARCINOGENIC CALCULATION

$$IEXnc = \frac{0.4\ mg/kg \times 200\ mg/day \times 350\ days/year \times 6\ years \times 1.0E\text{-}06\ kg/mg}{15\ kg \times 2190\ days}$$

IEXnc = 5.11E-06 mg/kg/day

HQ = 5.11E-06 mg/kg/day / 5.00E-04 (mg/kg/day) = Hazard Quotient

HQ = 1.0E-02

CLIENT: NAS JACKSONVILLE, FLORIDA		JOB NUMBER: 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH SOIL FUTURE ON-SITE CHILD RESIDENT		
BASED ON: USEPA, DEC. 2001		
BY: R. JUPIN	CHECKED BY:	DATE: 04/20/07

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from dermal contact with surface/subsurface soil at PSC 47.

EQUATION:

$$DEX = \frac{Cs \times CF \times SA \times AF \times ABS \times EF \times ED}{BW \times AT}$$

Where:

DEX	=	estimated exposure intake (mg/kg/day)
Cs	=	exposure point concentration in soil/sediment (mg/kg)
CF	=	conversion factor (1.0E-6 kg/mg)
SA	=	skin surface available for contact (cm^2/day)
ABS	=	absorption factor (unitless)
AF	=	adherence factor (mg/cm^2)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFd	=	dermal carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDd	=	dermal noncarcinogenic reference dose (mg/kg/day)

RISKS:

ICLR (Carcinogens) = Intake (mg/kg/day) x CSFd $(mg/kg/day)^{-1}$
HQ (Noncarcinogens) = Intake (mg/kg/day) / RFDd (mg/kg/day)

ASSUMPTIONS:

Cs	=	0.4	mg/kg	Chemical: alpha-Chlordane
CF	=	1.0E-06	kg/mg	
SA	=	2800	cm^2/day	
AF	=	0.2	mg/cm^2	
ABS	=	0.04		
EF	=	350	days/year	
ED	=	6	years	
BW	=	15	kg	
ATc	=	25550	days	
ATnc	=	2190	days	
CSFd	=	3.5E-01	$(mg/kg/day)^{-1}$	
RfDd	=	5.0E-04	(mg/kg/day)	

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH SOIL FUTURE ON-SITE CHILD RESIDENT		
BASED ON: USEPA, DEC. 2001		
BY: R. JUPIN	**CHECKED BY:**	**DATE:** 04/20/07

EXAMPLE CARCINOGENIC CALCULATION

$$DEXc = \frac{0.4\ mg/kg \times 1.0E\text{-}06\ kg/mg \times 2800\ cm2/day \times 0.2\ mg/cm2 \times 0.04 \times 350\ days/year \times 6\ years}{15\ kg \times 25550\ days}$$

DEXc = 4.91E-08 mg/kg/day

ICLR = 4.91E-08 mg/kg/day x 3.50E-01 (mg/kg/day)-1 = Incremental Lifetime Cancer Risk

ICLR = 1.7E-08

EXAMPLE NONCARCINOGENIC CALCULATION

$$DEXnc = \frac{0.4\ mg/kg \times 1.0E\text{-}06\ kg/mg \times 2800\ cm2/day \times 0.2\ mg/cm2 \times 0.04 \times 350\ days/year \times 6\ years}{15\ kg \times 2190\ days}$$

DEXnc = 5.73E-07 mg/kg/day

HQ = 5.73E-07 mg/kg/day / 5.00E-04 (mg/kg/day) = Hazard Quotient

HQ = 1.1E-03

CALCULATION WORKSHEET

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INHALATION OF FUGATIVE DUST EMISSIONS BY CHILD RESIDENTS		
BASED ON: U.S. EPA, DECEMBER 1989		
BY: R. JUPIN	**CHECKED BY:** T. Jupin	**DATE:** 10/18/2006

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from inhalation of fugitive dust and volatiles from subsurface soil.

EQUATION:

$$IEX = \frac{Ca \times IR \times ET \times EF \times ED}{BW \times AT}$$

Where:

IEX	=	estimated exposure intake (mg/kg/day)
Ca	=	exposure point concentration in air (mg/m3)
	=	Cs x 1/PEF
Cs	=	chemical concentration in soil (mg/kg)
PEF	=	particulate emission factor (m3/kg)
IR	=	inhlation rate (m3/hr)
ET	=	exposure time (hrs/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFi	=	inhalation carcinogenic slope factor ((mg/kg/day)$^{-1}$)
RfDi	=	inhalation noncarcinogenic reference dose (mg/kg/day)

RISKS:

ILCR (Carcinogens) = Intake (mg/kg/day) x CSFi (mg/kg/day)-1
HQ (Noncarcinogens) = Intake (mg/kg/day) / RFDi (mg/kg/day)

ASSUMPTIONS:

Cs	=	4	mg/kg	Chemical: alpha-Chlordane
PEF	=	1.24E+09	m3/kg	
Ca	=	3.23E-09	mg/m3	
IR	=	0.34	m3/hr	
ET	=	24	hr/day	
EF	=	350	days/year	
ED	=	6	years	
BW	=	15	kg	
ATc	=	25550	days	
ATnc	=	2190	days	
CSFi	=	3.5E-01	(mg/kg/day)$^{-1}$	
RfDi	=	2.0E-04	(mg/kg/day)	

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INHALATION OF FUGATIVE DUST EMISSIONS BY CHILD RESIDENTS		
BASED ON: U.S. EPA, DECEMBER 1989		
BY: R. JUPIN	**CHECKED BY:** T. Jupin	**DATE:** 10/18/2006

EXAMPLE CARCINOGENIC CALCULATION

$$IEXc = \frac{3.23E\text{-}09 \text{ mg/m3} \times 0.34 \text{ m3/hr} \times 24 \text{ hr/day} \times 350 \text{ days/year} \times 6 \text{ years}}{15 \text{ kg} \times 25550 \text{ days}}$$

IEXc = 1.44E-10 mg/kg/day

ILCR = 1.44E-10 mg/kg/day x 3.50E-01 (mg/kg/day)-1 = Incremental Lifetime Cancer Risk

ILCR = 5.1E-11

EXAMPLE NONCARCINOGENIC CALCULATION

$$IEXnc = \frac{3.23E\text{-}09 \text{ mg/m3} \times 0.34 \text{ m3/hr} \times 24 \text{ hr/day} \times 350 \text{ days/year} \times 6 \text{ years}}{15 \text{ kg} \times 2190 \text{ days}}$$

IEXnc = 1.68E-09 mg/kg/day

HQ = 1.68E-09 mg/kg/day / 2.00E-04 (mg/kg/day) = Hazard Quotient

HQ **8.4E-06**

CLIENT:	JOB NUMBER:

SUBJECT: CALCULATION OF PARTICUALATE EMISSION FACTOR FOR CONSTRUCTION WORKERS		
BASED ON: Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, December 2002)		
BY: R. JUPIN	CHECKED BY:	DATE: 03/31/2006

Equation 5-5
Derivation of the Particulate Emission Factor
Construction Scenario - Construction Worker

$$PEF_{sc} = Q/C_{sr} \times \frac{1}{F_D} \times \left[\frac{T \times A_R}{556 \times (W/3)^{0.4} \times \frac{(365d/yr - p)}{365d/yr} \times \Sigma VKT} \right]$$

Parameter/Definition (units)	Default
PEF_{sc}/subchronic road particulate emission factor (m^3/kg)	site-specific
Q/C_{sr}/ inverse of the ratio of the 1-h geometric mean air concentration to the emission flux along a straight road segment bisecting a square site (g/m^2-s per kg/m^3)	23.02[a] (Equation 5-6)
F_D/dispersion correction factor (unitless)	0.185 (Appendix E)
T/total time over which construction occurs (s)	site-specific
A_R/surface area of contaminated road segment (m^2) L_R/length of road segment (ft) W_R/width of road segment (ft)	274.213 ($A_R = L_R \times W_R \times 0.092903 m^2/ft^2$)
W/mean vehicle weight (tons)	site-specific
p/number of days with at least 0.01 inches of precipitation (days/year)	site-specific (Exhibit 5-2)
ΣVKT/sum of fleet vehicle kilometers traveled during the exposure duration (km)	site-specific

[a] Assumes a 0.5 acre site

Q/C	23.02	(g/m2-s per kg/m3)	
Fd	0.185	dispersion correction factor (unitless)	
T	4.32E+06	sec	3600 sec/hr x 8hr/day x 150days/yr
Area (A)	274.213	m^2	
W	8	tons	
p	115	day/year	
VKT	175.5	km	
PEF =	**1.49E+06**	**m^3/kg**	

CALCULATION WORKSHEET

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INGESTION OF GROUNDWATER ADULT RESIDENT		
BASED ON: USEPA, DEC. 1989		
BY: R. JUPIN	**CHECKED BY:** T. Jupin	**DATE:** 04/20/07

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from ingestion of groundwater by an adult resident.

EQUATION:

$$IEX = \frac{Cgw \times CF \times IF \times EF \times ED}{BW \times AT}$$

Where:

IEX	=	estimated exposure intake (mg/kg/day)
Cgw	=	exposure point concentration in groundwater (ug/L)
CF	=	conversion factor (1.0E-3 mg/ug)
IR	=	ingestion rate (L/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFo	=	oral carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDo	=	oral noncarcinogenic reference dose (mg/kg/day)

RISKS:

ICLR (Carcinogens) = Intake (mg/kg/day) x CSFo $(mg/kg/day)^{-1}$
HQ (Noncarcinogens) = Intake (mg/kg/day) / RFDo (mg/kg/day)

ASSUMPTIONS:

Cgw	=	2.58	ug/L	Chemical: Vinyl Chloride
IR	=	2	L/day	
CF	=	1.0E-03	mg/ug	
EF	=	350	days/year	
ED	=	24	years	
BW	=	70	kg	
ATc	=	25550	days	
ATnc	=	8760	days	
CSFo	=	1.5E+00	$(mg/kg/day)^{-1}$	
RfDo	=	3.0E-03	(mg/kg/day)	

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INGESTION OF GROUNDWATER ADULT RESIDENT		
BASED ON: USEPA, DEC. 1989		
BY: R. JUPIN	**CHECKED BY:** T. Jupin	**DATE:** 04/20/07

EXAMPLE CARCINOGENIC CALCULATION

$$IEXc = \frac{2.58\ ug/L \times 0.001\ mg/ug \times 2\ L/day \times 350\ days/year \times 24\ years}{70\ kg \times 25550\ days}$$

IEXc = 2.42E-05 mg/kg/day

ICLR = 2.42E-05 mg/kg/day x 1.50E+00 (mg/kg/day)-1 = Incremental Lifetime Cancer Risk

ICLR = 3.64E-05

EXAMPLE NONCARCINOGENIC CALCULATION

$$IEXnc = \frac{2.58\ ug/L \times 0.001\ mg/ug \times 2\ L/day \times 350\ days/year \times 24\ years}{70\ kg \times 8760\ days}$$

IEXnc = 7.07E-05 mg/kg/day

$$HQ = \frac{7.07E\text{-}05\ mg/kg/day}{3.00E\text{-}03\ (mg/kg/day)} = \text{Hazard Quotient}$$

HQ = 2.36E-02

CLIENT:		JOB NUMBER:
NAS JACKSONVILLE, FLORIDA		0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH GROUNDWATER ADULT RESIDENT		
BASED ON: USEPA, DEC. 1989, 2001		
BY: R. JUPIN	CHECKED BY:	DATE: 04/20/07

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from dermal contact with groundwater by an adult resident.

EQUATION:

$$DAD = \frac{DAevent \times EV \times ED \times EF \times A}{BW \times AT}$$

Where:

DAD	=	dermally absorbed dose (mg/kg/day)
DAevent	=	absorbed does per event (mg/cm^2/event)
EV	=	event frequency (events/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
A	=	skin surface available for contact (cm^2)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFo	=	oral carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDo	=	oral noncarcinogenic reference dose (mg/kg/day)

RISKS:

ICLR (Carcinogens) = DAD (mg/kg/day) x CSFd $(mg/kg/day)^{-1}$
HQ (Noncarcinogens) = DAD (mg/kg/day) / RFDd (mg/kg/day)

EQUATIONS for DAevent:

For Inorganics:

DAevent = Kp x Cw x CF x tevent

For Organics:

$$\text{If } tevent \le t^*, \text{ then: } DAevent = 2 \times FA \times Kp \times Cw \times CF \times \sqrt{\frac{6 \times tau \times tevent}{\pi}}$$

$$\text{If } tevent > t^*, \text{ then: } DAevent = FA \times Kp \times Cw \times CF \times \left[\frac{tevent}{1+B} + 2 \times tau \times \left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH GROUNDWATER ADULT RESIDENT		
BASED ON: USEPA, DEC. 1989, 2001		
BY: R. JUPIN	**CHECKED BY:** T. Jackson	**DATE:** 04/20/07

Where:

Kp	=	permeability coefficient from water (cm/hr)
Cgw	=	concentration of chemical in groundwater (mg/L)
tevent	=	duration of event (hr/event)
CF	=	conversion factor (0.001 L/cm^3)
t*	=	time it takes to reach steady-state (hr/event)
τ	=	lag time (hr/event)
B	=	Bunge Model Constant (dimensionless)

EXAMPLE CALCULATION OF DAevent

ASSUMPTIONS:

Cgw	=	0.0026	mg/L	Chemical: Vinyl Chloride
Kp	=	5.60E-03	cm/hr	
FA	=	1	unitless	
tevent	=	0.25	hr/event	
CF	=	0.001	L/cm^3	
t*	=	0.57	hr/event	
τ	=	0.24	hr/event	
B	=	0.017		

tevent < t*, therefore,

$$DAevent = (2 \times 0.0056\ cm/hr)\ (1)\ (0.00258\ mg/L)\ (0.001\ L/cm3) \times \sqrt{\frac{6 \times 0.24\ hr/event \times 0.25\ hr/event}{\pi}}$$

DAevent = 9.78E-09 mg/cm^2-event

RISK CALCULATIONS

ASSUMPTIONS:

A	=	18000	cm^2/day
EV	=	1	event/day
ED	=	24	years
EF	=	350	days/year
BW	=	70	kg
ATc	=	25550	days
ATnc	=	8760	days
CSFd	=	1.5E+00	$(mg/kg/day)^{-1}$
RfDd	=	3.0E-03	(mg/kg/day)

CLIENT: NAS JACKSONVILLE, FLORIDA		JOB NUMBER: 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM DERMAL CONTACT WITH GROUNDWATER ADULT RESIDENT		
BASED ON: USEPA, DEC. 1989, 2001		
BY: R. JUPIN	CHECKED BY:	DATE: 04/20/07

EXAMPLE CARCINOGENIC CALCULATION

$$DADc = \frac{9.78E\text{-}09 \text{ mg/cm2-event} \times 1 \text{ event/day} \times 24 \text{ years} \times 350 \text{ days/year} \times 18000 \text{ cm2/day}}{70 \text{ kg} \times 25550 \text{ days}}$$

DADc = 8.27E-07 mg/kg/day

DADc = 8.27E-07 mg/kg/day x 1.50E+00 (mg/kg/day)-1 = Incremental Lifetime Cancer Risk

ICLR = 1.24E-06

EXAMPLE NONCARCINOGENIC CALCULATION

$$DADnc = \frac{9.78E\text{-}09 \text{ mg/cm2-event} \times 1 \text{ event/day} \times 24 \text{ years} \times 350 \text{ days/year} \times 18000 \text{ cm2/day}}{70 \text{ kg} \times 8760 \text{ days}}$$

DADnc = 2.41E-06 mg/kg/day

HQ = 2.41E-06 mg/kg/day / 3.00E-03 (mg/kg/day) = Hazard Quotient

HQ = 8.04E-04

CALCULATION WORKSHEET

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: ESTIMATION OF AMBIENT AIR CONCENTRATIONS IN A TRENCH RESULTING FROM VOLATILE EMISSIONS FROM GROUNDWATER.		
BASED ON: VDEQ, 2002		
BY: R. JUPIN	**CHECKED BY:**	**DATE:** 04/20/07

PURPOSE: To calculate ambient air concentrations resulting from volatilization of chemicals from groundwater.

Ctrench = CGW x VF

Where:

Ctrench = concentration of contaminant in the trench µg/m^3
CGW = concentration of contaminant in groundwater µg/L
VF = volatilization factor L/m^3

1. Calculate kiG (gas-phase mass transfer coefficient of component i)

$kiG = (MWH2O/MWi)^{0.335} \times (T/298)^{1.005} \times kG, H2O$

Where:

kiG = gas-phase mass transfer coefficient of component i cm/s
MW_{H2O} = molecular weight of water = 18 g/mol
MW_{TCE} = molecular weight of TCE = 131.39 g/mol
kG,H_2O = gas-phase mass transfer coefficient of water vapor at 25°C cm/s = 0.833 cm/s
T = average system absolute temperature = 298
The value of kG, H_2O is 0.833 cm/s (Superfund Exposure Assessment Manual, U. S. EPA, April 1988)

$kiG = (18/131.39)^{0.335} \times (298/298)^{1.005} \times 0.833$ cm/s = 4.28E-01 cm/s

2. Calculate kiL (liquid-phase mass transfer coefficient of component i)

$kiL = (MWO_2/MWi)^{0.5} \times (T/298) \times kL, O_2$

Where:
kiL = liquid-phase mass transfer coefficient of component i cm/s
MW_{O2} = molecular weight of O_2 = 32 g/mol
MW_{TCE} = molecular weight of TCE = 131.39 g/mol
T = average system absolute temperature = 298
kL, O_2 = liquid-phase mass transfer coefficient of oxygen at 25°C cm/s = 0.002 cm/s

$kiL = (32/131.39)^{0.5} \times (298/298) \times 0.002$ cm/s = 9.87E-04 cm/s

CLIENT: NAS JACKSONVILLE, FLORIDA		JOB NUMBER: 0497
SUBJECT: ESTIMATION OF AMBIENT AIR CONCENTRATIONS IN A TRENCH RESULTING FROM VOLATILE EMISSIONS FROM GROUNDWATER.		
BASED ON: VDEQ, 2002		
BY: R. JUPIN	CHECKED BY:	DATE: 04/20/07

3. Calculate Ki (overall mass transfer coefficient of contaminant)

$Ki = 1 / \{(1/kiL) + [(RT) / (Hi \times kiG)]\}$

Where:

kiL = liquid-phase mass transfer coefficient of i cm/s =	9.87E-04
R = ideal gas constant atm-m^3/mole-°K =	8.20E-05
T = average system absolute temperature =	298
Hi = Henry's Law constant of TCE (atm-m^3/mol) =	1.03E-02
KiG = gas-phase mass transfer coefficient of i cm/s	4.28E-01

$Ki = 1 / \{(1/9.78E\text{-}4) + [(298 \times 8.2E\text{-}5) / (1.03E\text{-}2 \times 0.428]\}$ = 9.82E-04 cm/s

4. Calculation of VF (Volatilization Factor)

$VF = (Ki \times A \times F \times 10^{-3} \times 10^{4} \times 3{,}600) / (ACH \times V)$

Where:

VF = volatilization factor (L/m^3)		
Ki = overall mass transfer coefficient of contaminant =		9.82E-04 cm/s
A = area of the trench =		8.18 m^2
F = fraction of floor through which contaminant can enter (unitless) =		1
ACH = air changes per hour =		360 h^{-1}
V = volume of trench =		24.92 m^3
10^{-3} = conversion factor L/cm^3	0.001	
10^{4} = conversion factor cm^2/m^2	10000	
3,600 = conversion factor seconds/hr	3600	

$VF = (9.82E\text{-}4 \times 8.18 \times 1 \times 10^{-3} \times 10^{4} \times 3{,}600) / (360 \times 24.92)$ = 3.22E-02 L/m^3

5. Calculation of C_{trench} (concentration of contaminant in the trench)

$C_{trench} = C_{GW} \times VF$

Where:

C_{trench} = concentration of contaminant in the trench ($\mu g/m^3$)		
C_{GW} = concentration of TCE in groundwater =	2.75	µg/L
VF = volatilization factor =	3.22E-02	L/m^3

C_{trench} = 2.75 µg/L x 3.22E-02 L/m3 = **8.86E-02 $\mu g/m^3$**

CALCULATION WORKSHEET

CLIENT: NAS JACKSONVILLE, FLORIDA		**JOB NUMBER:** 0497
SUBJECT: CALCULATION OF INTAKE/RISK FROM INHALATION OF VOLATILE EMISSIONS FROM GROUNDWATER BY A CONSTRUCTION WORKER		
BASED ON: USEPA, DEC. 1989		
BY: R. JUPIN	**CHECKED BY:**	**DATE:** 04/20/07

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from inhalation of chemicals volatilizing from groundwater by a construction worker.

EQUATION:

$$IEX = \frac{Ca \times IR \times ET \times EF \times ED}{BW \times AT}$$

Where:

IEX	=	estimated exposure intake (mg/kg/day)
Ca	=	exposure point concentration in air (mg/m3)
IR	=	inhlation rate (m3/hr)
ET	=	exposure time (hrs/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFi	=	inhalation carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDi	=	inhalation noncarcinogenic reference dose (mg/kg/day)

RISKS:

ICLR (Carcinogens) = Intake (mg/kg/day) x CSFi $(mg/kg/day)^{-1}$
HQ (Noncarcinogens) = Intake (mg/kg/day) / RfDi (mg/kg/day)

ASSUMPTIONS:

Ca	=	8.86E-05	mg/m3	Chemical: Trichloroethene
IR	=	2.5	m3/hr	
ET	=	4	hr/day	
EF	=	30	days/year

TABLE 1
SELECTION OF EXPOSURE PATHWAYS
PSC 47 - NAVAL AIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Surface Soil	Surface Soil	Surface Soil	Maintenance Workers	Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Site maintenance workers, such as groundskeepers, may periodically enter the site and contact contaminated soil in the course of their job duties.
		Air	Surface Soil	Maintenance Workers	Adult	Inhalation	On-Site	Quantative	No COPCs were identified in soil for the inhalation pathway, therefore this pathway is not evaluated
		Surface Soil	Surface Soil	Trespassers	Adolescents and Adults	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Persons may trespass on the site and contact contaminated soil.
		Air	Surface Soil	Trespassers	Adolescents and Adults	Inhalation	On-Site	Quantative	Trespassers may be exposed to fugitive dust and volatile emissions.
Future	Surface Soil	Surface Soil	Surface Soil	Construction Workers	Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Construction workers may have contact with surface soil during excavation activities.
		Air	Surface Soil	Construction Workers	Adult	Inhalation	On-Site	Quantative	Construction workers may be exposed to fugitive dust and volatile emissions during construction activities.
		Surface Soil	Surface Soil	Occupational Workers	Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Occupational (commercial/industrial) workers, may contact contaminated soil in the course of their job duties.
		Air	Surface Soil	Occupational Workers	Adult	Inhalation	On-Site	Quantative	Occupational workers may be exposed to fugitive dust and volatile emissions.
	Surface Soil	Surface Soil	Surface Soil	Residents	Child	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to contaminated soil during typical residential activities, such as gardening or playing.
					Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to contaminated soil during typical residential activities, such as gardening or playing.
		Air	Surface Soil	Residents	Child	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to fugitive dust and volatile emissions.
					Adult	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to fugitive dust and volatile emissions.
	SubSurface Soil	SubSurface Soil	SubSurface Soil	Construction Workers	Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Construction workers may have contact with subsurface soil during excavation activities.
			SubSurface Soil	Residents	Child	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to contaminated subsurface soil that was brought to the surface.
					Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to contaminated subsurface soil that was brought to the surface.
		Air	SubSurface Soil	Construction Workers	Adult	Inhalation	On-Site	Quantative	Construction workers may be exposed to fugitive dust and volatile emissions during construction activities.
			SubSurface Soil	Residents	Child	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to fugitive dust and volatile emissions.
					Adult	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to fugitive dust and volatile emissions.
	Groundwater	Groundwater	Groundwater	Construction Workers	Adult	Ingestion Dermal	On-Site On-Site	None Quantative	Groundwater is not used as a potable water supply at the site. Construction workers may contact groundwater during excavation activities.
			Tap Water	Residents	Child	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to COPCs in groundwater if groundwater was used as a potable water source.
					Adult	Ingestion Dermal	On-Site On-Site	Quantative Quantative	Hypothetical on-site residents may be exposed to COPCs in groundwater if groundwater was used as a potable water source.
Future	Groundwater	Air	Groundwater	Construction Workers	Adult	Inhalation	On-Site	Quantative	Construction workers may contact groundwater during excavation activities.
			Tap Water	Residents	Child	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to COPCs in groundwater if groundwater was used as a potable water source.
					Adult	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to COPCs in groundwater if groundwater was used as a potable water source.
			Indoor Air	Residents	Child	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to COPCs that have volatilized from groundwater and migrated through building foundations into indoor air.
					Adult	Inhalation	On-Site	Quantative	Hypothetical on-site residents may be exposed to COPCs that have volatilized from groundwater and migrated through building foundations into indoor air.

TABLE 2.1
OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT
NAVAL AIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Scenario Timeframe: Current/Future
Medium: Surface Soil
Exposure Medium: Surface Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Location of Maximum Concentration	Detection Frequency[2]	Range of Nondetects[3]	Concentration Used for Screening[4]	Background Value[5]	Risk-Based COPC Screening Level[6]	Potential ARAR/TBC Value	Potential ARAR/TBC Source[7]	USEPA SSL Soil to Air[8]	COPC Flag[9]	Rationale for Contaminant Deletion or Selection

Footnotes:
1- Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Sample and duplicate are counted as one sample when determining frequency of detection.
3 - Values presented are sample-specific quantitation limits.
4 - The maximum detected concentration is used for screening purposes.
5 - Value presented is twice the mean concentration.
6 - The risk-based COPC screening level for residential exposures to soil is presented. The value is based on a target Hazard Quotient of 0.1 for non-carcinogens (denoted with a "N" flag) or an incremental cancer risk of 1E-6 for carcinogens (denoted with a "C" flag) (USEPA, Region 9, October 2004).
The RBCs for non-carcinogenic compounds are divided by 10
7 - Soil Cleanup Target Levels taken from Table II, FAC 62-777 (FDEP, February 2005).
8 - USEPA Soil Screening Levels. USEPA Internet Site at http://risk.lsd.ornl.gov/calc_start.htm (SSLs for non-carcinogens are divided by 10).
9 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level and/or ARAR/TBC(s) and background levels
10 - Value is for pyrene.
11 - Value is for chlordane.
12 - Value is for alpha-BHC.
13 - Value is for endosulfan.
14 - Value is for endrin.

Shading indicates that the maximum detected concentration exceeded the screening criteria; therefore, the chemical was retained as a COPC.

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value with undetermined bias
N = Non-carcinogen
NA = Not Applicable/Not Available
max = ceiling limit
sat = soil saturation limit
SSL = Soil Screening Level

Rationale Codes:
For selection as a COPC
ASL = Above COPC Screening Level/ARAR/TBC

For elimination as a COPC:
BSL = Below COPC Screening Level/ARAR/TBC
FREQ = Frequency of detection

TABLE 2.2
OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - MIGRATION TO GROUNDWATER
NAVAL AIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Scenario Timeframe: Current/Future
Medium: Surface Soil
Exposure Medium: Surface Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Location of Maximum Concentration	Detection Frequency[2]	Range of Nondetects[3]	Concentration Used for Screening[4]	Background Value[5]	USEPA SSL Soil to Groundwater[6]	Potential ARAR/TBC Value	Potential ARAR/TBC Source[7]	COPC Flag[8]	Rationale for Contaminant Deletion or Selection

Footnotes
1- Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Sample and duplicate are counted as one sample when determining frequency of detection.
3 - Values presented are sample-specific quantitation limits.
4 - The maximum detected concentration is used for screening purposes.
5 - Value presented is twice the mean concentration.
6 - USEPA Soil Screening Levels. USEPA Internet Site at http://risk.lsd.ornl.gov/calc_start.htm (SSLs for non-carcinogens are divided by 10).
7 - Soil Cleanup Target Levels taken from Table II, FAC 62-777.
8 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level and/or ARAR/TBC(s) and background levels.
9 - Value is for chlordane.

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value with undetermined bias
Definitions Continued:
MCL = Maximum Contaminant Level
N = Non-carcinogen
NA = Not Applicable/Not Available
SSL = Soil Screening Level

Shading indicates that the maximum detected concentration exceeded the screening criteria; therefore, the chemical was retained as a COPC.

Rationale Codes:
For selection as a COPC:
ASL = Above COPC Screening Level/ARAR/TBC

For elimination as a COPC:
BSL = Below COPC Screening Level/ARAR/TBC
NTX = No toxicity criteria

TABLE 2.3
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT
NAVAL AIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Scenario Timeframe: Current/Future
Medium: Subsurface Soil
Exposure Medium: Subsurface Soil

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Location of Maximum Concentration	Detection Frequency[2]	Range of Nondetects[3]	Concentration Used for Screening[4]	Background Value[5]	Risk-Based COPC Screening Level[6]	Potential ARAR/TBC Value	Potential ARAR/TBC Source[7]	USEPA SSL Soil to Air[8]	COPC Flag[9]	Rationale for Contaminant Deletion or Selection

Footnotes
1- Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Sample and duplicate are counted as one sample when determining frequency of detection.
3 - Values presented are sample-specific quantitation limits.
4 - The maximum detected concentration is used for screening purposes.
5 - Value presented is twice the mean concentration.
6 - The risk-based COPC screening level for residential exposures to soil is presented. The value is based on a target Hazard Quotient of 0.1 for non-carcinogens (denoted with a "N" flag) or an incremental cancer risk of 1E-6 for carcinogens (denoted with a "C" flag) (USEPA, Region 9, October 2004). The RBCs for non-carcinogenic compounds are divided by 10.
7 - Soil Cleanup Target Levels taken from Table II, FAC 62-777 (FDEP, February 2005).
8 - USEPA Soil Screening Levels, USEPA Internet Site at http://risk.lsd.ornl.gov/calc_start.htm (SSLs for non-carcinogens are divided by 10).
9 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level and/or ARAR/TBC(s) and background levels.
10 - Value is for pyrene
11 - Value is for chlordane.
12 - Value is for alpha-BHC.
13 - Value is for endosulfan.
14 - Value is for endrin.

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value with undetermined bias
N = Non-carcinogen
NA = Not Applicable/Not Available
max = ceiling limit
sat = soil saturation limit
SSL = Soil Screening Level

Rationale Codes:
For selection as a COPC
ASL = Above COPC Screening Level/ARAR/TBC

For elimination as a COPC:
BSL = Below COPC Screening Level/ARAR/TBC

Shading indicates that the maximum detected concentration exceeded the screening criteria; therefore, the chemical was retained as a COPC

Footnotes
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Sample and duplicate are counted as one sample when determining frequency of detection.
3 - Values presented are sample-specific quantitation limits.
4 - The maximum detected concentration is used for screening purposes.
5 - Value presented is twice the mean concentration.

Footnotes Continued
6 - The risk-based COPC screening level for tap water use is presented. The value is based on a target Hazard Quotient of 0.1 for non-carcinogens (denoted with a "N" flag) or an incremental cancer risk of 1E-6 for carcinogens (denoted with a "C" flag) (USEPA, Region 9, October 2004). The PRG for non-carcinogenic compounds are divided by 10.
7 - Groundwater Cleanup Target Levels taken from Table I, FAC 62-777 (FDEP, February 2005).
8 - 2006 Edition of the Drinking Water Standards and Health Advisories, USEPA (EPA 822-R-06-013) Summer 2006.
9 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level and/or ARAR/TBC(s) and background levels.
10 - Value is for chlordane
11 - Value is for alpha-BHC.
12 - Value is for endosulfan
13 - Value is for endrin

Shading indicates that the maximum detected concentration exceeded the screening criteria; therefore the chemical was retained as a COPC.

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
FDEP = Florida Department of Environmental Protection
J = Estimated value with undetermined bias

Definitions
MCL = Maximum contaminant level
N = Non-carcinogen
NA = Not Applicable/Not Available

Rationale Codes:
For selection as a COPC
ASL = Above COPC Screening Level/ARAR/TBC

For elimination as a COPC:
BKG = Within background levels
BSL = Below COPC Screening Level/ARAR/TBC

TABLE 2.6
OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - VAPOR INTRUSION
NAVAL AIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Scenario Timeframe: Current/Future
Medium: Groundwater
Exposure Medium: Groundwater

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Location of Maximum Concentration	Detection Frequency[2]	Range of Nondetects[3]	Concentration Used for Screening[4]	Background Value[5]	Risk-Based COPC Screening Level[6]	COPC Flag[7]	Rationale for Contaminant Deletion or Selection

Footnotes
1- Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Sample and duplicate are counted as one sample when determining frequency of detection.
3 - Values presented are sample-specific quantitation limits.
4 - The maximum detected concentration is used for screening purposes.
5 - Value presented is twice the mean concentration.
6 - Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils. November 2002. EPA530-F-02-052. Values are from Table 2c and correspond to a target cancer risk level of 1E-6 or HI =1.
7 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - Value is for chlordane.

Shading indicates that the maximum detected concentration exceeded the screening criteria; therefore, the chemical was retained as a COPC.

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value with undetermined bias
N = Non-carcinogen
NA = Not Applicable/Not Available

Rationale Codes:
For selection as a COPC
ASL = Above COPC Screening Level/ARAR/TBC

For elimination as a COPC:
BSL = Below COPC Screening Level/ARAR/TBC
NTX = No toxicity criteria available
FREQ = Frequency of detection

Notes:
N = Normal
NP = Non-parametric
L = Lognormal
J = Estimated value.
1 - There were less than 10 samples, therefore the maximum detected concentration was used for the exposure point concentration.
2 - The Shapiro-Wilks, Anderson-Darling, and Kolmogorov-Smirnov tests indicate that the data is non-parametric. The ProUCL guidance recommends that the 99% Chebyshev(Mean, Std) UCL be used as the exposure point concentration.
3 - The Shapiro-Wilks W test indicates that the data are lognormally distributed. The ProUCL guidance recommends that the H-UCL be used as the exposure point concentration.
4 - The Shapiro-Wilks W test indicates that the data are lognormally distributed. The ProUCL guidance recommends that the 95% Chebyshev(Mean, Std) UCL be used as the exposure point concentration.
5 - The Shapiro-Wilks, Anderson-Darling, and Kolmogorov-Smirnov tests indicate that the cata is non-parametric. The ProUCL guidance recommends that the 97.5% Chebyshev(Mean, Std) UCL be used as the exposure point concentration.

Notes:
For non-detects, 1/2 sample quantitation limit was used as a proxy concentration; for duplicate sample results, the average value was used in the calculation.
Statistics: Mean of Normal Data (Mean-N).
(1) - Mean concentration is used as the exposure point concentration for groundwater in accordance with EPA Region IV guidance.

APPENDIX L

RISK ASSESSMENT METHODS

APPENDIX M
FOOD CHAIN MODELING

Food chain modeling was conducted as part of COPC refinement. The objective of the food chain modeling was to investigate potential risks to representative receptors from screening-level COPCs that are known to bioaccumulate or biomagnify (USEPA, 2000a). Toxicity reference values (TRVs), which are contaminant doses associated with adverse effects on growth, survival, and reproduction, were obtained for comparison to doses that the receptors may receive in the environment. TRVs were preferentially selected that represent a threshold for sublethal effects, such as impairment of reproduction or growth. Since toxicity data for the specific receptors chosen herein were not available, toxicity data from laboratory species were extrapolated to receptor species. The TRVs were obtained from wildlife toxicity data that were summarized by Sample et al. (1996). If only a no-observed-adverse-effect level (NOAEL) was available, the value was multiplied by 10 to derive an estimated lowest-observed-adverse-effect level (LOAEL). If only a LOAEL was available, the value was divided by 10 to derive an estimated NOAEL. TRVs used in this ecological risk assessment and their sources are presented in Table M-1.

Food chain modeling was limited to COPCs that are known to bioaccumulate or biomagnify (USEPA, 2000a). USEPA Region IV considers chemicals in this category to consist of those so designated in USEPA's (2000b) *Appendix to Bioaccumulation Testing and Interpretation for the Purpose of Sediment Quality Assessment, Status and Needs, Chemical-Specific Summary Tables*, with the exception of PAHs. USEPA Region IV does not consider PAHs to bioaccumulate unless they are present in percent levels in soil. COPCs at PSC 47 that are known to bioaccumulate or biomagnify consist of pesticides. The remaining COPCs are not known to bioaccumulate or biomagnify and were not included in the food chain model.

Risk via the food chain was evaluated using two scenarios. The first scenario used maximum detected pesticide concentrations and conservative assumptions for body weight, food consumption, and soil ingestion. The second scenario used average pesticide concentrations, and average values for body weight, food consumption, and soil ingestion.

REPRESENTATIVE RECEPTORS

Representative ecological receptors used in the food chain model for PSC 47 consisted of the short-tailed shrew (*Blarina brevicauda*) and American robin (*Turdus migratorius*), both of which are found at NAS Jacksonville. Information regarding these representative receptors is presented below and in Table M-2, and is taken from a literature review performed by USEPA (1993). Table M-3 presents the exposure parameters that were used in the food chain modeling, and was derived from Table M-2.

Short-tailed shrew (*Blarina brevicauda*)

Shrews inhabit a wide variety of habitats and are common in areas with abundant vegetative cover. They need cool, moist habitats because of their high metabolic and water-loss rates. The short-tailed shrew is primarily carnivorous, eating insects such as earthworms, slugs, and snails.

The adult body weight for the short-tailed shrew in various habitats ranged from 0.015 to 0.01921 kg with an average of 0.0161 kg. Wet-weight food ingestion rates were 0.49 and 0.62 g/g-day. The food ingestion rates in kg/day were calculated as shown in Table M-2. The food ingestion rates were then multiplied by 0.16, because earthworms consist of approximately 16 percent solids and 84 percent moisture (Sample et al., 1997), to convert the ingestion rate from a wet-weight value to a dry-weight value. The incidental soil ingestion rate was calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested (assumed 3 percent for conservative food chain model and 1.5 percent for the average food chain model) from USEPA (2003). The 90th percentile value is 3 percent and 1.5 percent is the 50th percentile value from USEPA (2003).

American Robin (*Turdus migratorius*)

Habitat for the American robins consists of parks, lawns, moist forests, swamps, open woodlands, and orchards. Robins forage on the ground in open areas, along habitat edges, or the edges of streams. They also may forage above ground in shrubs and within the lower branches of trees. In the months preceding and during the breeding season, robins feed primarily on invertebrates.

The adult body weight for the American robin in New York woodlands and forests and in Pennsylvania ranged from 0.0773 to 0.0862 kg with an average of 0.0804 kg. The only listed food ingestion rates were for robins in Kansas (1.52 g/g-day) and California (0.89 g/g-day), with an average of 1.205 g/g-day. Studies calculating ingestion rates for the robin included in the USEPA (1993) review are based on a diet comprised of berries. Based on these studies, the food ingestion rates in kg/day were calculated as shown in the attached table. The food ingestion rates were then multiplied by 0.23, which is the portion of solids in fruit (Sample et al., 1997) to convert the ingestion rate from a wet-weight value to a dry-weight value. However, because the robin is being used in the ecological risk assessment to represent insectivorous/vermivorous birds, it is assumed that the 100 percent of the robin's diet is invertebrates, and the ingestion rate for the robin was calculated using field metabolism scaling as presented in Table M-2 following (Nagy et al., 1999). The Nagy-derived values were used in the food chain model for PSC 47.

The incidental soil ingestion rate was calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested (assumed 3 percent for the conservative food chain model and 1.5 percent for the average food chain model) from USEPA (2003). The 3 percent and 1.5 percent values are based on

the shrew since it is assumed that both the shrew and robin are consuming 100 percent soil invertebrates, and no incidental soil ingestion rate was available for the robin.

Exposure Estimate and Risk Calculation

The following equation presents the food chain model that was used for the shrew and robin:

$$CDI = \frac{[(Cf * If) + (Cs * Is)]}{BW}$$

where:

CDI	=	Chronic daily intake (mg/kg-day)
Cf	=	Contaminant concentration in food (earthworm) (mg/kg)
If	=	Ingestion rate of food (kg/day)
Cs	=	Contaminant concentration in surface soil (mg/kg)
Is	=	Rate of incidental surface soil ingestion (kg/day)
BW	=	Body weight (kg)

The chemical concentrations in earthworms were calculated using the following equation:

$$Ce = BAF_e * Cs$$

Where:

Ce = Chemical concentration in earthworm

BAF_e = Soil-to-invertebrate bioaccumulation factor (unitless)

The bioaccumulation factors are presented in Table M-4.

The risk characterization is the final phase of a risk assessment that compares the exposure to the ecological effects. It is at this phase that the likelihood of adverse effects occurring as a result of exposure to a stressor. A Hazard Quotient (HQ) approach was used to characterize the risk to terrestrial receptors. This approach characterizes the potential effects by comparing exposure concentration with the effects data. The HQ for the terrestrial wildlife model is calculated as follows:

$$HQ = \frac{CDI}{TRV}$$

Where:

HQ	=	Hazard Quotient, (unitless)
CDI	=	Chronic daily intake dose, (mg/kg-day)
TRV	=	Toxicity Reference Value, (mg/kg-day)

An HQ of less than 1.0 is considered to indicate that potential risks to the representative ecological receptors are low. An HQ of greater than 1.0 at this stage in the risk assessment process indicates that potential risks to ecological receptors may occur.

Calculation spreadsheets for the representative receptors are presented as Tables M-5 through M-8 and an example calculation is presented following Table M-8.

EXAMPLE CALCULATION OF HAZARD QUOTIENT FOR THE AMERICAN ROBIN USING THE MAXIMUM SURFACE SOIL CONCENTRATION OF ENDRIN CONSERVATIVE SCENARIO

The predicted dose for representative receptors = $\frac{[(Cf * If) + (Cs * Is)]}{BW}$

Cf = Contaminant concentration (mg/kg) in food (soil invertebrates)
If = Ingestion rate of food (kg/day)
Cs = Contaminant concentration in surface soil (mg/kg)
Is = Incidental surface soil ingestion (kg/day)
BW = Body weight (kg)

Concentrations of pesticide compounds in food items of the robin (Cf) were derived from soil data by multiplying the soil concentration by a soil-to-invertebrate BAF.

BAF for endrin = 3.6 (Table M-4)
Cs = 1.21 mg/kg (Table 8-1)
Using these values, Cf = 1.21 mg/kg × 3.6 = 4.356 mg/kg.

If = 0.01247 kg/day (Conservative scenario, Table M-3)
Is = 0.0003741 kg/day (Conservative scenario, Table M-3)
BW = 0.0773 (Conservative scenario, Table M-3)
Using the above values,
dose = [(4.356 mg/kg × 0.01247 kg/day) + (1.21 mg/kg × 0.0003741 kg/day)] ÷ 0.0773 kg
= (0.054319 mg/day + 0.0004527 mg/day) ÷ 0.0773 kg = 0.70856 mg/kg/day

The avian NOAEL for endrin is 0.01 mg/kg/day (Table M-1).
Thus, the NOAEL-based HQ = 0.70856 mg/kg/day ÷ 0.01 mg/kg/day = 70.856 ≈ 70.9 (as shown in Table 8-2).

Endrin[5]	0.01	NOAEL	reproduction	>83 days	screech owl	Fleming et al., 1982	Sample et.al., 1996
Heptachlor[6]	1	LOAEL	reproduction	181 days	mink	Crum et al., 1993	Sample et.al., 1996

1 BHC (mixed isomers) TRVs used for delta-BHC.
2 BHC (mixed isomers) TRVs from quail study used as avian TRVs for beta-BHC, since avian TRVs were not available for beta-BHC.
3 Chlordane TRVs used for alpha- and gamma-chlordane.
4 4,4'-DDT TRVs used for 4,4'-DDE and 4,4'-DDD.
5 Endrin TRVs used for endrin aldehyde and endrin ketone.
6 Heptachlor TRVs used for heptachlor epoxide.

Note: If only a NOAEL was available, the value was multiplied by 10 to derive an estimated LOAEL. If only a LOAEL was available, the value was divided by 10 to derive an estimated NOAEL.

TABLE M-2
DERIVATION OF EXPOSURE FACTORS FOR FOOD CHAIN MODEL
PSC 47 PESTICIDE AREA
NAVAL AAIR STATION JACKSONVILLE
JACKSONVILLE, FLORIDA

Data from EPA (1993) unless otherwise noted				Derivation of Factors for Modeling		
Species/Factor	**Age/Sex/ Cond./Season**	**Value**	**Study Average**	**Calculation of Values**		**Notes**
American Robin						
Body Weight (g)	A B	77.3	77.3	Minimum Value	0.0773 kg	
				Maximum Value	0.0862 kg	
	A M nonbreeding	86.2		Overall Average	0.0804 kg	
	A F nonbreeding	83.6	84.9			
	A M breeding	77.4				
	A F breeding	80.6	79			
Food Ingestion Rate (g/g-day)	B B free-living	0.89		Food ingestion rates were calculated from Nagy et al., (1999) for insectivores as follows:		
				Conservative scenario:	0.01247 kg/day	Used maximum body weight in below equation
	- B free-living	1.52				
				Average scenario:	0.01188 kg/day	Used average body weight in below equation
	Overall Average		1.21			
The above data were from robins that were consuming only fruit. Since the robin is being used to represent birds at PSC 47 that consume soil invertebrates rather than fruit, food ingestion rates were based on metabolic scaling using Nagy et al (1999) equation for avian insectivores.				Food ingestion rates (dry weight) were calculated from Nagy et al., (1999) for insectivores as follows: $FI = (9.7 \times BW(g)^{0.705})/18kJ/g/1000$		
Soil Ingestion: Data not available for this species.				The soil ingestion rate for the robin will be assumed to be the same as the shrew (3% of diet).		
Short-Tailed Shrew						
Body Weight (g)	A B	15	15	Minimum Value	0.0150 kg	
				Maximum Value	0.01921 kg	
	M summer	19.21	17.27	Overall Average	0.01613 kg	
	F summer	17.4				
	M fall	16.87				
	M fall	15.58				
Food Ingestion Rate (g/g-day)	A B	0.49		Conservative scenario:	0.0016 kg/day	Maximum ingestion rate x Average Body weight x 0.16[(1)]
	A B	0.62		Average scenario:	0.00143 kg/day	Average ingestion rate x Average Body weight x 0.16[(1)]
	Overall Average		0.555			[(1)] 0.16 = 16 percent solids in earthworms used to convert to a dry weight ingestion rate
Soil Ingestion Rate = 3% of diet (90th percentile of data from USEPA [2003]).						

Notes:
A = Adult
F = Female, M = Male, B = Both
BW = Body Weight

Notes:

BAF - bioaccumulation factor = worm concentration/soil concentration

NA - Not applicable or not available

1 - The calculated dry weight BAF was either obtained directly from the study or was calculated by dividing the wet weight BAF by 0.16. Earthworms are assumed to consist of 16 percent solids (Sample et al., 1997).

2 - In the food chain modeling, DDT BAF was used for DDD and DDE, gamma-BHC BAF was used for beta- and delta-BHC, chlordane BAF was used for alpha- and gamma-chlordane, and endrin BAF was used for endrin aldehyde and endrin ketone.

3 - The compost studies were not used in calculating the average BAF because properties of the compost (organic carbon, etc) will be considerably different than soils at PSC 47. Data from compost studies are presented for informational purposes only.

4 - This value was used as the soil-to-invertebrate BAF in the ecological risk assessment for PSC 47.

CALCULATIONS AND COST ESTIMATES

1.0 ASSUMPTIONS

The following assumptions are made based upon results of field investigations:

- As illustrated on attached Figure 9-5, there are two groundwater contaminant plumes at PSC 47 including a Northern Plume with elevated concentrations of VOCs, SVOCs, and pesticides and a Southern Plume with elevated concentrations of VOCs, SVOCs, pesticides and arsenic.

- The Northern Plume includes monitoring wells 536-MW03S, MW11S, MW12S, MW13S, MW13D, and MW25S. This plume is approximately 500 feet long by 100 to 200 feet wide and extends along a west-northwest to east-southeast axis, overlapping the greater part of Building 536.

- The Southern Plume includes monitoring wells MW01S, MW02S, MW03S, MW04S, MW05S, MW06D, MW14S, MW17S, and MW17D. This plume is approximately 400 feet long by 200 feet wide bisecting Building 937 along a north-south axis.

- Within the Southern Plume an area located within and immediately south of Building 937 has been identified as containing the highest detections of arsenic (up to 23 mg/L) and has been designated as the Arsenic Hot Spot. The Arsenic Hot Spot includes wells MW01S, MW02S, MW03S, MW04S, MW05S, and MW06D and is approximately 10,800 ft^2 in size (0.247 acres & 117 feet in diameter).

- The thickness of contaminated groundwater is estimated at approximately 20 ft.

2.0 NORTHERN PLUME SURFACE AREA, THICKNESS, AND VOLUME

2.1. Northern Plume Surface Area

As shown on attached Figure 9-5 the surface area of the Northern Plume is estimated at approximately 64,600 ft^2.

2.2 Northern Plume Thickness

As stated in the assumptions the thickness of contaminated groundwater is estimated at approximately 20 ft. Groundwater surface elevation is approximately 5 ft below ground surface (bgs).

2.3 Northern Plume Volume

Groundwater in the Northern Plume area occurs in overburden with a typical porosity of 0.3. Therefore, the estimated volume of contaminated groundwater in the Northern Plume can be computed as follows:

64,600 ft^2 x 20 ft x 0.3 = 387,600 ft^3 or 2,899,000 gallons

3.0 NORTHERN PLUME COCS QUANTITIES COMPUTATIONS

The quantities of COCs within the Northern Plume groundwater can be computed based upon the volume of contaminated groundwater and the average concentrations of these COCs in that area. Average concentrations are assumed to be the mathematical average of the historical concentrations detected in samples collected from monitoring wells located within the Northern Plume.

Average concentrations (in µg/L) of COCs in the Northern Plume groundwater are computed in the table below. Analytical results shown on this table are those for samples collected at the indicated date that corresponds to the latest sampling.

Site-Specific COC	536-MW03	MW11S	MW12S	MW13S	MW13D	MW25S	Average
VOCs							
Benzene	2	2.5					1.42
Isopropylbenzene		9				2.5	2.45
Trichloroethene		4.5					3.25
SVOCs							
1,1-Biphenyl		8 J				5 J	2.50
2-Methylnaphthalene		103					40.50
Naphthalene		194				30	46.67
Pesticides							
Aldrin		0.11		0.011 J			0.021
alpha-BHC	4.2	9.3	1.1	2.7		3.4	3.451
beta-BHC		1.2	0.7	0.32		1.8	0.677
delta-BHC	4.6	8.3		2.3		3.6	3.833
gamma-BHC		15		3.3		4.4	3.883
4,4'-DDD	48			0.69	0.31		8.217
4,4'-DDE	0.92 J						0.237
4,4'-DDT				0.49			0.165
Dieldrin		0.033 J	0.15	0.036 J			0.046

NOTES
Blank spaces denote that detected concentration did not exceed the GCTL/MCL. Concentration is conservatively assumed to be equal to the GCTL/MCL for the calculation of the average.
J Estimated value

Quantities (in pounds) of COCs in the Northern Plume groundwater can be calculated according to the following formula:

$$\text{Quantity} = (2{,}899{,}000 \text{ gallons}) \times (8.34 \text{ lb/gal}) \times (\text{average } \mu\text{g/L concentration}) \times (10^{-9})$$

Accordingly, estimated quantities of COCs in the Northern Plume groundwater are as follows:

Site-Specific COC	**Quantity** (pounds)
Benzene	0.034
Isopropylbenzene	0.059
Trichloroethene	0.079
Subtotal VOCs	**0.172**
1,1-Biphenyl	0.060
2-Methylnaphthalene	0.979
Naphthalene	1.128
Subtotal SVOCs	**2.067**
Aldrin	0.0005
alpha-BHC	0.0834
beta-BHC	0.0164
delta-BHC	0.0927
gamma-BHC	0.0939
4,4'-DDD	0.1987
4,4'-DDE	0.0057
4,4'-DDT	0.0040
Dieldrin	0.0011
Subtotal Pesticides	**0.4964**
Total COCs	**2.7354**

4.0 SOUTHERN PLUME SURFACE AREA, THICKNESS, AND VOLUME

4.1. Southern Plume Surface Area

As shown on attached Figure 9-5 the surface area of the Southern Plume is estimated at approximately 69,100 ft^2.

4.2 Southern Plume Thickness

As stated in the assumptions the thickness of contaminated groundwater is estimated at approximately 20 ft. Groundwater surface elevation is approximately 5 ft bgs.

4.3 Southern Plume Volume

Groundwater in the Southern Plume area occurs in overburden with a typical porosity of 0.3. Therefore, the estimated volume of contaminated groundwater in the Southern Plume can be computed as follows:

69,100 ft^2 x 20 ft x 0.3 = 414,600 ft^3 or 3,101,000 gallons

5.0 SOUTHERN PLUME COCS QUANTITIES COMPUTATIONS

The quantities of COCs within the Southern Plume groundwater can be computed based upon the volume of contaminated groundwater and the average concentrations of these COCs in that area. Average concentrations are assumed to be the mathematical average of the historical concentrations detected in samples collected from monitoring wells located within the Southern Plume.

Average concentrations (in µg/L) of COCs in the Southern Plume groundwater are computed in the table below. Analytical results shown on this table are those for samples collected at the indicated date that corresponds to the latest sampling.

NOTES

Blank spaces denote that detected concentration did not exceed the GCTL/MCL. Concentration is conservatively assumed to be equal to the GCTL/MCL for the calculation of the average.

J Estimated value

Quantities (in pounds) of COCs in the Southern Plume groundwater can be calculated according to the following formula:

$$\text{Quantity} = (3{,}101{,}000 \text{ gallons}) \times (8.34 \text{ lb/gal}) \times (\text{average } \mu g/L \text{ concentration}) \times (10^{-9})$$

Accordingly, estimated quantities of COCs in the Southern Plume groundwater are as follows:

Site-Specific COC	Quantity (pounds)
Benzene	0.11
1,2-Dibromo-3-Chloropropane	0.01
cis-1,2-Dichloroethene	8.59
Ethylbenzene	1.08
Isopropylbenzene	0.05
Tetrachloroethene	0.09
Trichloroethene	0.10

Arsenic (total)	114.3
Arsenic (dissolved)	98.1
Subtotal Metals	**114.3**
Total COCs	**138.18**

7.0 SOUTHERN PLUME ARSENIC HOT SPOT SURFACE AREA, THICKNESS, AND VOLUME

7.1. Southern Plume Arsenic Hot Spot Surface Area

As shown on attached Figure 9-5 the surface area of the Southern Plume Arsenic Hot Spot is estimated at approximately 10,800 ft^2.

7.2 Southern Plume Arsenic Hot Spot Thickness

As stated in the assumptions the thickness of contaminated groundwater is estimated at approximately 20 ft. Groundwater surface elevation is approximately 5 ft bgs.

7.3 Southern Plume Arsenic Hot Spot Volume

Groundwater in the Southern Plume Arsenic Hot Spot area occurs in overburden with a typical porosity of 0.3. Therefore, the estimated volume of contaminated groundwater in the Southern Plume Arsenic Hot Spot can be computed as follows:

10,800 ft^2 x 20 ft x 0.3 = 64,800 ft^3 or 484,700 gallons

8.0 SOUTHERN PLUME ARSENIC HOT SPOT COCS QUANTITIES COMPUTATIONS

The quantities of COCs within the Southern Plume Arsenic Hot Spot groundwater can be computed based upon the volume of contaminated groundwater and the average concentrations of these COCs in that area. Average concentrations are assumed to be the mathematical average of the historical concentrations detected in samples collected from monitoring wells located within the Southern Plume Arsenic Hot Spot.

Average concentrations (in µg/L) of COCs in the Southern Plume Arsenic Hot Spot groundwater are computed in the table below. Analytical results shown on this table are those for samples collected at the indicated date that corresponds to the latest sampling.

Site-Specific COC	MW01S	MW02S	MW03S	MW04S	MW05S	MW06D	Average

Tetra Tech NUS		STANDARD CALCULATION SHEET	
CLIENT: SouthDiv	FILE No: 112GN3966.0000.HY0110100	BY: JLG	PAGE: 1 OF 1
SUBJECT: PSC 47 RI/FS, NAS Jacksonville Alternative GW-3A: Northern Plume In-Situ Enhanced Bioremediation		CHECKED BY:	DATE: 04/21/07

1.0 DESIGN ASSUMPTIONS

The following design assumptions are made based on the results of a site-specific bench-scale treatability study (TtNUS, 2007) and on typical design parameters for similar in-situ enhanced bioremediation projects:

- As demonstrated by a site specific bench-scale treatability study (TtNUS, 2007), in-situ bioremediation of the organic COCs of the Northern Plume, and particularly that of the pesticides, can be effectively enhanced by the addition of an emulsified vegetable oil type electron donor.
- The emulsified vegetable oil will be injected will be performed with the use of multiple direct push technology (DPT) injection wells.
- The average radius of influence (ROI) of each DPT injection well is approximately 10 ft.
- Only one chemical injection event will be required.
- In-situ chemical oxidation and precipitation will be completed within approximately one year.

2.0 DPT INJECTION SYSTEM

ROI of each DPT injection well: $(10\ ft)^2 \times \pi = 314\ ft^2$

Approximate surface area of Northern Plume (see Appendix A. 1):
340 ft x 190 ft = 64,600 ft^2

Number of DPT injection wells: 64,600 $ft^2 \div 314\ ft^2$/injection well = 206, say 230 wells

DPT injection wells will be installed to a depth of 25 ft below ground surface (bgs) and arranged as shown on attached figure.

3.0 EMULSIFIED VEGETABLE OIL INJECTION

Typical rate of emulsified oil injection is approximately 10 lbs per active foot of depth of the DPT injection well

Emulsified oil injected in each DPT well:
10 lbs/ ft x 20 ft = 200 lbs emulsified oil per DPT well, or approximately 27 gallons per well (@ 7.5 lbs/gal)

Emulsified oil is typically diluted 10-to-1 with water for injection

Volume injected in each DPT well: 27 gal x 10 = 270 gallons per DPT well

Total emulsified oil use for the Northern Plume:
200 lbs/DPT well x 230 DPT wells = 46,000 lbs vegetable oil

Notes
One-day visit to verify LUC RD
Labor and supplies to collect samples from wells using a crew of two.
Analyze groundwater samples from 21 wells for VOCs, SVOCs, pesticides & arsenic in years 1 through 30. Collect samples 4 times a year in year 1, twice a year in years 2 & 3, and once a year for years 4 through 30.
Analyze groundwater samples from 15 wells for natural attenuation parameters. For 9 wells collect samples 4 times a year in year 1, twice a year in years 2 & 3, and once a year for years 4 & 5. For 6 wells collect samples 4 times a year in year 4, twice a year in years 5 & 6, and once a year for years 7 & 8.
Document sampling events and results

1.0 DESIGN ASSUMPTIONS

The following design assumptions are made based upon information for other similar in-situ chemical treatment projects:

- The arsenic of the Southern Plume Arsenic Hot Spot can be effectively oxidized and immobilized through the combined subsurface injection of a ferric iron salt such as ferric chloride ($Fe\ Cl_3$) and an oxygen release compound (ORC) such as magnesium peroxide (MgO_2).
- Chemical injection will be performed with the use of multiple direct push technology (DPT) injection wells.
- The average radius of influence (ROI) of each DPT injection well is approximately 8 ft.
- Only one chemical injection event will be required.
- In-situ chemical oxidation and precipitation will be completed within approximately one year.

2.0 DPT INJECTION SYSTEM

ROI of each DPT injection well: $(8\ ft)^2 \times \pi = 201\ ft^2$

Approximate surface area of Arsenic Hot Spot is 10,800 ft^2 (see Appendix --)

Number of DPT injection wells: 10,800 $ft^2 \div 201\ ft^2$/injection well = 53.7, say 55 wells

DPT injection wells will be installed to a depth of 25 ft below ground surface (bgs) and arranged as shown on attached figure.

3.0 IRON SALT INJECTION

Arsenic co-precipitation requires approximately 1 mg/L ferric iron per 50 µg/L of arsenic.

Based on average soluble arsenic concentration detected in plume (see Appendix), required ferric iron concentration:
1 mg/L x (5,699 µg/L ÷ 50 µg/L) = 113.98, say 115 mg/L

Because current analytical data show that approximately 20 mg/L ferric iron is already present, it is assumed that the ferric iron concentration of the arsenic hot spot will have to be increased by 95 mg/L through subsurface injection.

Estimated volume of arsenic hot spot: 10,800 ft^2 x 20 ft x 0.3 = 64,800 ft^3 or 484,700 gal

Required ferric iron quantity: 484,700 gal x 95 mg/L x 8.34 lbs/gal x 10^{-6} = 384 pounds
Required ferric chloride quantity: 384 pounds x (162.5 ÷ 56) = 1,114, say 1,150 pounds of $FeCl_3$
Double this quantity to counterbalance inefficiencies in the injection process
Ferric chloride is typically available commercially as a 40% (wt) solution with a specific gravity of 11.7 lbs/gal
Required quantity of commercial ferric solution: 1,150 lbs x 2 ÷ (0.4 x 11.7 lbs/gal) = 491, say 500 gal 40% $FeCL_3$ solution

Assume that the commercial 40% $FeCl_3$ will be diluted 100 to 1 for injection:

Volume injected per DPT well: 500 gal x 100 ÷ 55 wells = 909 gal/well

2.0 ORC INJECTION

Rate of ORC injection per DPT well: 10 lbs/ft x 20 ft = 200 lbs per DPT well

Total ORC use for the arsenic hot spot: 200 lbs/DPT well x 55 DPT wells = 11,000 lbs ORC.

1.0 ASSUMPTIONS

Contaminated soil computations are based on the following assumptions:

- Contaminated soil are defined as soil with concentrations of chemicals of concern (COCs) that are greater than either of the Florida Department of Environmental Protection (FDEP's) Soil Cleanup Target Levels (SCTLs) for direct residential exposure (thereafter referred to as residential SCTLs), or SCTLs for direct industrial exposure (thereafter referred to as industrial SCTLs), or SCTLs for leachability to groundwater (thereafter referred to as leachability SCTLs).

- The soil Preliminary Remedial Goals (PRGs) for this FS are defined as either the residential or leachability SCTLs, whichever are the lower.

- The industrial SCTLs are also considered as the direct exposure criteria instead of the residential SCTLs and together with the leachability SCTLs for the development of active remedial actions that address existing unacceptable human health risks under the current industrial site use.

- The industrial SCTLs are also used by themselves as disposal criteria to determine which portion of any excavated soil would be identified as RCRA-hazardous.

- Contaminated soils are divided by depth into surface soil and subsurface soil. The depth of surface soil contamination is assumed to extend to 2 feet below ground surface (bgs). The depth of subsurface soil contamination is assumed to extend from 2 feet bgs to the groundwater table, which at PSC 47 occurs at approximately 5 feet bgs.

- The bulk density of excavated PSC 47 soil is assumed to be 1.5 tons per cubic yard (yd^3).

2.0 COMPUTATIONS OF SOIL EXCEEDING PRGs

2.1. Surface Soil

As shown on attached Figure 9-1, 3 areas of surface soil were identified as containing soil with concentrations of COCs greater than the PRGs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)	Bulk Weight (tons)
1	88,424	2	176,848 / 6,550	9,825
2	3,271	2	6,542 / 242	363
3	717	2	1,434 / 53	79
Total	**92,412**	**2**	**184,824 / 6,845**	**10,267**

2.2 Subsurface Soil

As shown on attached Figure 9-2, 4 areas of subsurface soil were identified as containing soil with concentrations of COCs greater than the PRGs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area	Depth	Volume	Bulk Weight

	(ft^2)	(ft)	(ft^3/yd^3)	(tons)
1	36,354	3	109,062 / 4,039	6,058
2	7,178	3	21,534 / 798	1,197
3	17,124	3	51,372 / 1,903	2,854
4	5,742	3	17,226 / 638	957
Total	**66,398**	**3**	**199,194 / 7,378**	**11,066**

2.3 Totals

The estimated total volume of soil exceeding PRGs is:
6,845 + 7,378 = 14,223, say 14,250 yd^3
The estimated total weight of soil exceeding PRGs is:
10,267 + 11,066 = 21,333, say 21,350 tons

3.0 COMPUTATIONS OF SOIL EXCEEDING INDUSTRIAL AND/OR LEACHABILITY SCTLs

3.1. Surface Soil

As shown on attached Figure 9-3, 5 areas of surface soil were identified as containing soil with concentrations of COCs greater than their industrial and/or leachability SCTLs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)	Bulk Weight (tons)
1	1,117	2	2,234 / 83	124
2	2,167	2	4,334 / 160	240
3	24,812	2	49,624 / 1,838	2,757
4	40,771	2	81,542 / 3,020	4,530
5	382	2	764 / 28	42
Total	**69,249**	**2**	**138,498 / 5,129**	**7,693**

3.2 Subsurface Soil

As shown on attached Figure 9-4, 5 areas of subsurface soil were identified as containing soil with concentrations of COCs greater than their industrial and/or leachability SCTLs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)	Bulk Weight (tons)
1	24,500	3	73,500 / 2,722	4,083
2	9,698	3	29,094 / 1,078	1,617
3	11,879	3	35,637 / 1,320	1,980
4	5,001	3	15,003 / 556	834
5	951	3	2,853 / 106	150
Total	**52,029**	**3**	**156,087 / 5,782**	**8,664**

3.3 Totals

The estimated total volume of soil exceeding industrial and/or leachability SCTLs is:
5,129 + 5,782 = 10,911, say 10,900 yd^3
The estimated total weight of soil exceeding industrial and/or leachability SCTLs is:
7,693 + 8,664 = 16,357, say 16,350 tons

4.0 COMPUTATIONS OF SOIL EXCEEDING INDUSTRIAL SCTLs (RCRA-HAZARDOUS)

4.1. Surface Soil

As shown on attached Figure 10-1X, 3 areas of surface soil were identified as containing soil with concentrations of COCs greater than the industrial SCTLs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)	Bulk Weight (tons)
1	12,839	2	25,678 / 951	1,426
2	32,261	2	64,522 / 2,390	3,585
3	382	2	764 / 28	42
Total	**45,482**	**2**	**90,964 / 3,369**	**5,053**

4.2 Subsurface Soil

As shown on attached Figure 10-4X, 5 areas of subsurface soil were identified as containing soil with concentrations of COCs greater than the industrial SCTLs. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)	Bulk Weight (tons)
1	9,698	3	29,094 / 1,078	1,617
2	15,963	3	47,889 / 1,774	2,661
3	4,139	3	12,417 / 460	690
4	812	3	2,436 / 90	135
5	951	3	2,853 / 106	159
Total	**31,562**	**3**	**94,689 / 3,508**	**5,262**

4.3 Totals

The estimated total volume of soil exceeding industrial SCTLs is:
3,369 + 3,508 = 6,877, say 6,900 yd^3
The estimated total weight of soil exceeding industrial SCTLs is:
5,053 + 5,262 = 10,315, say 10,300 tons

1.0 REMEDIAL APPROACH

- Areas of the site with concentrations of soil COCs greater than the industrial and/or leachability SCTLs will be capped with a 2-foot thick impervious cover system to allow industrial exposure and to prevent leaching of soil COCs to groundwater.
- To maintain the current topography of the site and to allow unimpeded access to existing buildings, surface preparation of the areas to be capped will require excavation to a depth equal to the thickness of the cap.
- Because the planned thickness of the cap is 2 feet, pre-excavation will result in the removal of all surface soil exceeding industrial and/or leachability SCTLs, leaving only subsurface soil with concentrations of COCs greater than industrial and/pr leachability SCTLs to be capped.
- The areas to be capped will be covered with a 2-foot thick layer of compacted soil with a permeability of 10^{-6} centimeters per second (cm/sec).
- The pre-excavated areas that do not require capping will be backfilled with clean fill.
- The capped and backfilled areas will be re-vegetated or re-paved to match original surface conditions.

2.0 VOLUMES COMPUTATIONS

2.1. Site Preparation Excavation

As shown on attached Figure 11-1, 3 areas of surface soil will need to be excavated as part of site preparation. The surface areas, depth, and volume of these areas can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	83,600	2	167,200 / 6,193
2	951	2	1,902 / 70
3	382	2	764 / 28
Total	**85,133**	**2**	**169,866 / 6,291**

2.2 Soil Capping

As shown on attached Figure 11-2, 5 areas of subsurface soil were identified as containing soil with concentrations of COCs greater than industrial and/or leachability SCTLs and need to be capped. The surfaces of areas to be capped and volumes of capping material can be computed as follows:

.

Area	Surface to be Capped (ft^2)	Cap Thickness (ft)	Volume of Cap Material (ft^3/yd^3)
1	24,500	2	49,000 / 1,815
2	9,698	2	19,396 / 718
3	11,879	2	23,758 / 880
4	5,001	2	10,002 / 370
5	951	2	1,902 / 70
Total	**52,029**	**2**	**104,058 / 3,853**

2.3 Total Excavation and Disposal Volumes

Estimated total volume of soil to be excavated is:
6,291, say 6,300yd^3

Estimated total volume of uncontaminated excavated soil:
6,300 yd^3 – 5,150yd^3 (from Appendix) = 1,150 yd^3 or 1,725 tons

Estimated total volume of RCRA non-hazardous excavated soil (from Appendix):
5,150 yd^3 – 3,350 yd^3 = 1,800 yd^3 or 2,700 tons

Estimated total volume of RCRA hazardous excavated soil (from Appendix):
3,350 yd^3 or 5,025 tons

2.4 Backfilling and Site Restoration

The estimated total volume of required clean backfill is:
6,291 - 3,853 = 2,438, say 2,450 yd^3
Imported clean backfill required:
2,450 – 1,150 = 1,300 yd^3
As per Figure 11-1, surface to be re-paved is 20,068 ft^2
Therefore, surface to be re-vegetated is:
85,133 – 20,068 = 65,065 ft^2
Volume of required top soil @ 6-inch thickness:
65,065 x 0.5 = 32,532 ft^3, or 1,205 yd^3

1.0 REMEDIAL APPROACH

- Areas of the site with concentrations of soil COCs greater than the industrial SCTLs will be excavated and disposed off-site to allow industrial exposure.
- Areas of the site with concentrations of soil COCs greater than the leachability SCTLs will be capped with a 2-foot thick impervious cover system to prevent leaching of soil COCs to groundwater.
- To maintain the current topography of the site and to allow unimpeded access to existing buildings, surface preparation of the areas to be capped will require excavation to a depth equal to the thickness of the cap.
- Because the planned thickness of the cap is 2 feet, pre-excavation will result in the removal of all surface soil exceeding industrial and/or leachability SCTLs, leaving only subsurface soil with concentrations of COCs greater than industrial to be further excavated and subsurface soil with concentrations of COCs greater than leachability SCTLs to be capped.
- The areas to be capped will be covered with a 2-foot thick layer of compacted soil with a permeability of 10^{-6} centimeters per second (cm/sec).
- The excavated areas that do not require capping will be backfilled with clean fill.
- The capped and backfilled areas will be re-vegetated or re-paved to match original surface conditions.

2.0 VOLUMES COMPUTATIONS

2.1. Site Preparation Excavation

As shown on attached Figure 11-1, 3 areas of surface soil will need to be excavated as part of site preparation. The surface areas, depth, and volume of these areas can be computed as follows:

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	83,800	2	167,200 / 6,193
2	951	2	1,902 / 70
3	382	2	764 / 28
Total	**85,133**	**2**	**169,866 / 6,291**

.

2.2 Subsurface Soil Excavation

As shown on attached Figure 11-3, 5 areas of subsurface soil exceeding industrial SCTLs will need to be excavated. The surface areas, depth, and volume of these areas can be computed as follows:

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	9,698	3	29,094 / 1,078

2	15,963	3	47,889 / 1,774
3	4,139	3	12,417 / 460
4	812	3	2,436 / 90
5	951	3	2,853 / 106
Total	**31,562**	**3**	**94,689 / 3,508**

2.3 Soil Capping

As shown on attached Figure 11-3, 4 areas of subsurface soil that exceed leachability SCTLs and were not excavated will need to be capped. The surfaces of areas to be capped and volumes of capping material can be computed as follows:

.

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	7,708	2	15,416 / 571
2	829	2	1,658 / 61
3	5,001	2	10,002 / 370
4	6,927	2	13,854 / 513
Total	**20,464**	**2**	**40,140 / 1,515**

2.4 Total Excavation and Disposal Volumes

Estimated total volume of soil to be excavated is:
6,291 + 3,508 = 9,799, say 9,800yd^3

Estimated total volume of uncontaminated excavated soil (same as Alternative S-2):
6,300 yd^3 – 5,150yd^3 (from Appendix) = 1,150 yd^3 or 1,725 tons

Estimated total volume of RCRA non-hazardous excavated soil (from Appendix):
9,800 yd^3 – (6,900 + 1,150) yd^3 = 1,750 yd^3 or 2,625 tons

Estimated total volume of RCRA hazardous excavated soil (from Appendix):
6,900 yd^3 or 10,350 tons

2.5 Backfilling and Site Restoration

The estimated total volume of required clean backfill is:
9,800 yd^3 excavated - (1,150 yd^3 non-cont + 1,500 yd^3 cap) = 7,150 yd^3 or 10,725 tons
As per Figure 11-1, surface to be re-paved is 20,068 ft^2
Therefore, surface to be re-vegetated is:
85,133 – 20,068 = 65,065 ft^2
Volume of required top soil @ 6-inch thickness:
65,065 x 0.5 = 32,532 ft^3, or 1,205 yd^3

1.0 REMEDIAL APPROACH

- Areas of the site with concentrations of soil COCs greater than the residential and/or leachability SCTLs will be excavated and disposed off-site to allow residential exposure and to prevent leaching of soil COCs to groundwater.

- The excavated areas will be backfilled with clean fill. and re-vegetated or re-paved to match original surface conditions.

2.0 VOLUMES COMPUTATIONS

2.1. Surface Soil Excavation

As shown on attached Figure 11-4, 3 areas of surface soil were identified as containing soil with concentrations of COCs greater than the PRGs. The surface areas, depth, and volume of these areas can be computed as follows:

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	103,364	2	206,728 / 7,657
2	6,375	2	12,750 / 472
3	717	2	1,434 / 53
Total	**110,456**	**2**	**220,912 / 8,182**

2.2 Subsurface Soil Excavation

As shown on attached Figure 11-5, 4 areas of subsurface soil were identified as containing soil with concentrations of COCs greater than the PRGs. The surface areas, depth, and volume of these areas can be computed as follows:

Area	Surface Area (ft^2)	Depth (ft)	Volume (ft^3/yd^3)
1	36,354	3	109,062 / 4,039
2	7,178	3	21,534 / 798
3	17,124	3	51,372 / 1,903
4	5,742	3	17,226 / 638
Total	**66,398**	**3**	**199,194 / 7,378**

2.3 Total Excavation and Disposal Volumes

Estimated total volume of soil to be excavated is:
8,182 + 7,378 = 15,560, say 15,550 yd^3

Estimated total volume of uncontaminated excavated soil:
15,550 yd^3 – 14,250 yd^3 (from Appendix) = 1,300 yd^3 or 1,950 tons

Estimated total volume of RCRA non-hazardous excavated soil (from Appendix):
14,250 yd^3 – 6,900 yd^3 = 7,350 yd^3 or 11,025 tons

Estimated total volume of RCRA hazardous excavated soil (from Appendix):
6,900 yd^3 or 10,350 tons

2.4 Backfilling and Site Restoration

The estimated total volume of required clean backfill is:
15,550 – 1,300 = 14,250 yd^3
As per Figure 11-4, surface to be re-paved is 26,784 ft^2
Therefore, surface to be re-vegetated is:
109,822 – 26,784 = 83,038 ft^2
Volume of required top soil @ 6-inch thickness:
83,038 x 0.5 = 41,519 ft^3, or 1,538 yd^3
