Subject: UXO 1 and 2 - Supplemental Sampling

Good morning Roger.

We're in the process of finalizing the RFI and we'll be recommending some followup sampling for two locations near the Midway RV park. There were super high lead detections at SRSB23 and SRSB24 (see red box below) and we like to see whether the RFI data represents actual soil concentrations or did a lead pellet make it past our sampling crew. To verify, we'd propose a recommendation to collect three surface soil sample around each of the two hot spots - spaced about 10' in a triangular form (see red circles on below figure). The data would be submitted as a supplement to the RFI, at a later date via a tech memo.

We'd appreciate your thoughts on the approach and whether it would be satisfactory. If it is, we'll revise the SAP w/ addendum and we can use your email response to document approval and keep moving forward. If you'd like to conference and discuss with Navy, they're available the week after Thanksgiving (December 2).

Thanks Roger.

Ben
