**Subject:** MGBG Tech Memo

Gentlemen,

I finally had a chance to sit down with the MGBG Tech Memo. I am fine with the plan proposed within, but would like you to add more wells to the shallow GW further northwest of 01-25 and perhaps one north of 01-08. What needs to be shown for CA750 purposes, is that the plume is bounded and stable (or shrinking). Some wells have increased in concentration from 1980 to 2001 (e.g., for TCE 01-15: 12 ppb to 310;

01-25: 59 ppb to 65 ppb) and it goes on to note that horizontal extent of contamination has not been defined.

Please let me know if you have any questions. Talk to you tomorrow!

Peter
