TABLE OF CONTENTS

LIST OF APPENDICES

1.0 INTRODUCTION

Heritage Environmental Services, Inc. (Heritage) was retained by the Navy Public Works Center, Great Lakes (PWC-GL) and the Naval Training Center, Great Lakes (NTC-GL) to perform a limited remedial action in respect to a leaking underground storage tank (LUST) located at Building 1600A at the United States Navy, Great Lakes Training Center. The LUST incident was apparently related to the former distribution piping, which had not been removed when the prior tanks had been replaced with the existing tanks. These existing tanks were removed on September 17, 1998.

In early September 1997, R.W. Collins, Inc. obtained the necessary permits, and on September 17, 1997 removed two (2) 10,000 gallon gasoline underground storage tanks (USTs), one (1) 6,500 gallon diesel UST, and the associated fuel dispensers. Following the removal of the USTs, residual petroleum impacted soils were observed withi9n the excavation. On September 25, 1997, Heritage mobilized to the site to remove the distribution piping and to excavate the petroleum contaminated soils within the immediate area of the former USTs. As approved by the Illinois EPA these excavated soils were transported to the Navy Fire Fighting Training Unit (FFTU) Building 3304 to be bio-remediated. During the performance of these limited remedial actions, Heritage also conducted a subsurface soil and groundwater investigation in the area of the former LUSTs to define the extent and magnitude of the petroleum contamination associated with these LUSTs.

This report has been prepared to document and summarize the activities conducted at the site and the findings of the investigative activities. The basis of the classification of this site and recommendations for further actions are also provided in this report.

1.1 Site Location

The site is identified as Building 1600A, Ray Street, Naval Training Center, Great Lakes, Lake County, Illinois. The site is geographically located Lake County, Illinois, in the SE quarter, of the NW quarter, of the SE quarter, of Section 5, Township 44 North, Range 12 East, East of the Third Principal Meridian, Longitude 87° 51.115' West, Latitude 42°

18.907' North. The location of the site is shown in Appendix 1, Figure 1. Figure 1, is reproduced from the USGS 7.5 minute Waukegan Quadrangle Topographic Map, Photorevised 1980.

1.2 Site Description

The site is located within the confines of the United States Navy, Great Lakes Training Facility. The site was utilized as a fueling station for US Navy motor pool vehicles from 1972 to September 1997. The UST's were registered with the Illinois Office of the State Fire Marshal (OSFM). The site was assigned OSFM Facility Registration No. 2023810.

Building 1600A was originally constructed in the 1950's for use as a fueling station for NTC vehicles. At this time two (2) 10,000-gallon steel USTs were installed along with steel distribution piping. In 1974, the gasoline steel storage tanks were replaced with fiberglass tanks, and a new 6,500-gallon fiberglass diesel storage tank was installed. The existing distribution piping was not replaced.

During 1997, the Navy relocated the fueling operations to a different area of the Great Lakes Naval Facility. In September 1997, R.W. Collins, Inc removed the USTs at the site. The UST removal activities included the excavation and removal of the three USTs, vent lines, and the fuel dispensers. The distribution lines remained in place until removed by Heritage in September 1997. The location of the former UST system is shown in Figure 2, Appendix 1.

1.3 UST Information

Three USTs were formerly located at the site, as shown in Appendix 1, Figure 2. The USTs were reportedly installed in 1972 (OSFM Registration Records) and consisted of two 10,000-gallon capacity gasoline tanks (OSFM record Tank's 1 and 2) and one 6,500-gallon capacity diesel tank (OSFM record Tank 3). The UST's were reported as single-wall fiberglass construction. Distribution piping was reported as single-wall steel construction

and was encased in concrete. The fuel dispensers were located approximately 70 feet north of the USTs.

In late 1990, a tank tightness test was performed on the UST System. The results of the tank tightness test indicated a leak in the dispenser lines. The Illinois Emergency Services and Disaster Agency (IESDA) was notified, and the site was assigned the incident number 90-3584. As a result of the UST system's failure of the tightness test in February 1991, Versar, Inc., Oak Brook, Illinois (Versar), performed an investigation of the subsurface soils in the area of the product dispenser piping to evaluate the potential impact to subsurface soils. The results of this investigation indicated that petroleum constituents had impacted the subsurface soils in the area of the dispensers. Subsequent to this determination, the two unleaded gasoline tanks were taken out of service until replacement of the UST dispenser piping was completed. In April 1991, the UST dispenser piping was replaced. Prior to the placement of the new dispenser piping, and back-filling of the excavated piping trench, two soil samples were collected from the floor of the excavated trench and submitted to a laboratory for analysis of petroleum constituents. One sample (TB1) was reported to exhibit BETX constituents above IEPA Cleanup Criteria. The sample TB1 was collected from the floor of the excavation trench for the replacement dispenser pipeline and near the fuel dispenser island.

After completion of the new dispenser piping installation, the piping was again tested for its tightness to confirm a leak-free installation. The system passed the tightness test. The piping trench was then back-filled, and the UST system was returned to service.

Approximately 55 cubic yards of petroleum impacted soils were excavated from the piping trench and transported for disposal. The quantity of petroleum product released as a result of this incident was unknown.

In September 1997, the UST System at the site was taken out of service, and the USTs were excavated and removed. The removal of the UST system was the result of a planned UST decommissioning and not the result of a new release incident. During the performance of the UST removal activities, petroleum impacted soils were encountered

1.4 UST Removal

On September 17, 1997, R.W. Collins Co. exposed the top of the tanks. Beaver Oil Company, Inc. pumped out the contents (gasoline, diesel and water mixture). The inside of the tanks were purged with high pressure water until the LEL was below 5%, then the rinseate and the residual sludges were pumped from the tanks until they were until empty. The fiberglass tanks were uncovered and lifted out from the excavation. The tanks were punctured and purged again with high-pressure water. This rinseate was then pumped from the tank. A total of 400 gallons of gasoline-water mixture (rinseate, sludge, gasoline, and diesel) was transported and disposed at the Beaver Oil Company, Inc. in Hodgkins, Illinois.

OSFM Inspector, George Pinkowski, was present to monitor these activities. Based upon inspection of the USTs it was determined that the USTs were not leaking. During the tank removal activities it was determined that the fill material, which is sand, and groundwater in this area had been impacted by petroleum hydocarbons. It was suspected that the original steel tank/piping had previously leaked. The site was reportedly classified by the OSFM. Based upon the site conditions, Heritage and the PWC-GL assume that the site was classified as a high priority site.

The incident was reported to the Illinois Emergency Management Agency (IEMA). The IEMA Incident number is 971739.

The fiberglass tanks along with any associated the fiberglass piping was transported by R.W. Collins Company to Newton County Landfill in Brook, Indiana for disposal.

Copies of the Removal Permit, Certificate of UST Destruction/Disposal Waste Manifest, Notification for Underground Storage Tanks, photographs, and the 20-Day Report are included in Appendix 11.

2.0 SITE INVESTIGATION

2.1 Subsurface Soil Investigation Activities

On September 25, 1997, Heritage mobilized the necessary personnel and equipment to perform a subsurface soil investigation at the site. The purpose of the investigation was to collect data for evaluation of the magnitude and extent of contamination of the subsurface soils and groundwater as a result of past operations of the former USTs at the site. At the time of the site investigation, the UST tanks and product dispensers had been excavated and removed from the site, although the product dispenser piping remained in place. Photographs reporting the various site activities are provided in Appendix 8.

2.1.1 Soil Boring and Sample Collection Procedures

Subsurface investigation activities at the site were performed utilizing a GeoProbe® drilling and soil sample collection technique. Drilling and soil sample collection was performed by Innovative Probing Solutions, Inc. (IPC), Mount Vernon, Illinois. Heritage provided engineering oversight for the investigative activities. Heritage oversight activities included determination of the location for constructed soil borings, sample collection intervals, sample logging, laboratory sample submittal, and other activities as necessary to coordinate and direct the site investigation.

IPS utilized a van-mounted GeoProbe® unit to advance all soil borings performed at the site and to collect soil samples. A total of 35 soil borings were advanced at the site. Soil borings were identified as B-1 through B-35. Soil boring logs for the borings completed at the site are provided in Appendix 2. Location for the soil borings at the site are shown in Appendix 1, Figure 3.

The GeoProbe® technique utilized at the site involves the use of hydraulic or manually driven probing equipment that allows the collection of soil and groundwater samples at discrete depths in the subsurface. A rotary impact hammer drill and masonry drill bit was utilized to drill through hard surface cover materials encountered at the site (concrete and asphalt) and allow insertion of the sample collection tube and probe rods to the underlying soils. Soil samples were collected into polypropylene sample-tube liners, which were inserted into the sample tubes. Appropriate drive rods are attached to the sample tube as the sample tube is driven into the subsurface until the sample collection depth is reached. The sample tube is then driven through the sample collection interval (4-foot length). The drive rods and sample tube, containing the collected sample, were removed from the boring, and the sample tube liner was removed from the sample tube.

The retrieved sample tube liner was cut open to expose the soil sample. A portion of the soil sample was collected into a laboratory supplied sample container for possible laboratory analysis (BETX and PNAs), labeled and placed in the sample cooler. A separate portion of the collected sample was placed into a container for PID/head-space testing and an additional sample collected for on-site analysis by IPS. The PID/head-space sample was set aside while the remaining sample was logged for soil types. After completion of the soil log, a PID/head-space reading was performed on the headspace sample and was recorded in the boring log. PID meter results are also summarized in Table 1, Appendix 4. Selected soil samples were analyzed on-site utilizing a field gas chromatograph for BETX compounds. Field analytical results are included in Appendix 5.

The sample tube and retractable drive point were decontaminated between each use by a detergent wash and water rinse. The sample tube components were dried, a new sample liner was installed, and the sample tube was reassembled for reuse.

At completion of each soil boring, the soil boring was abandoned by back-filling the borehole with bentonite clay to surface grade.

2.1.2 Soil Sampling Procedures

Soil samples collected for laboratory analysis were collected into one 2-ounce (BETX) and one 4-ounce (PNA) glass jars. Laboratory soil samples were packed for zero-headspace and labeled at the time of collection indicating sample collection location, sample ID, collection date and time, and requested laboratory analysis. To prevent sample cross-contamination, single-use latex sample gloves were utilized by the sample collector during all sample collection and handling activities. The soil samples were placed in an ice packed sample cooler, to maintain sample temperature at approximately 4°C, until shipment to the receiving laboratory was completed. Laboratory samples were logged on laboratory sample Chain of Custody Forms and transported to the receiving laboratory under Chain of Custody Documentation procedures. Laboratory Certificate of Analysis, Sample Certification Forms and Chain of Custody Documents are provided in Appendix 6.

2.2 Groundwater Investigation Activities

2.2.1 Piezometer Installation Procedures

Four piezometers were installed at the site utilizing GeoProbe® techniques. Innovative Probing Solutions, Inc. (IPS) performed the piezometer construction and installation. The piezometers are identified as P-1, P-2, P-3, and P-4. The piezometers were installed at the site to provide a means to evaluate local groundwater gradient and flow direction. In addition, groundwater samples were collected from the piezometers to evaluate the potential for petroleum impact upon groundwater at the site.

Soil boring procedures for the installation of the piezometers were similar to the procedures for advancing the soil borings of with the exception of soil sample collection activities. Soil samples were not collected from piezometer locations P-2, P-3, and P-4, as these locations were adjacent to soil boring locations B-13, B-11, and B-9, respectively. Soil samples were collected and logged during the installation of piezometer P-1. Where soil samples were not collected, an oversize drive shoe was attached to the drive rods to provide for a slightly larger borehole; facilitating the installation of the piezometer materials.

Piezometers installed at the site were constructed from PVC material. To prevent cross contamination during storage and transportation, all construction material arrived on-site in factory packaging material (plastic wrapping). In addition, single use nitrile sample gloves were utilized during handling, assembly, and installation of the piezometers. Piezometer-screen sections utilized at the site were five feet in length, utilized 0.010-inch mill slots, and were sheathed in a silt-sock to inhibit silt size particles from entering the piezometer through the screened section. The piezometer riser and riser-cap were also constructed of PVC materials. All well sections utilized threaded, PVC wire-tie, or press-on attachment; no glue or adhesives were utilized in piezometer construction or installation. A sand filter pack was poured in place around the screened section. A granular bentonite clay was poured in place above the screened section to surface grade to provide a seal for the annulus space of the riser piping. Piezometer well construction logs are provided in Appendix 3. The locations of the piezometers installed at the site are shown in Appendix 1, Figure 4.

2.2.2 Groundwater Sampling Procedures

On October 10, 1997, a reference survey was performed at the site to establish a vertical elevation reference datum. Locations of the soil borings, piezometers, as well as other surface grade features, were surveyed. Water level measurements were

then recorded from the piezometers. A summary of the survey data and groundwater elevation measurements are provided in Appendix 4, Table 5.

Subsequent to recording groundwater level measurements at each piezometer, the groundwater within the piezometers was purged by removal of 5 times the calculated standing volume of water within each piezometer. Piezometer purging and subsequent groundwater sample collection were facilitated utilizing a MasterFlex® Peristaltic Pump and single-use polypropylene tubing. A length of polypropylene tubing was inserted into, and extended to the base of the piezometer; the other end of the tubing was attached to the MasterFlex® pump. The pump was operated until 5 volumes of standing water were removed from the piezometer or the piezometer was purged dry. Subsequent to purging each piezometer, a groundwater sample was then collected directly into laboratory sample containers for BETX (2-40 ml. Glass vials with septum caps) and PNA analysis (1 Liter Amber-Glass container).

The collected groundwater samples were labeled at the time of collection indicating sample collection location, sample ID, collection date and time, and requested laboratory analysis. To prevent sample cross-contamination, single-use latex sample gloves were utilized by the sample collector during all sample collection and handling activities. The collected laboratory samples were placed in an ice packed sample cooler, to maintain sample temperature at approximately 4C, until shipment to the receiving laboratory was completed. Laboratory samples were logged on laboratory sample chain of custody forms and transported to the receiving laboratory under chain of custody documentation procedures. Laboratory certificates of analysis, sample certification forms and sample chain of custody documents are provided in Appendix 7.

3.0 FIELD AND LABORATORY ANALYTICAL RESULTS

A summary of the IPS field analytical results, provided by IPS, are provided in Appendix 4, Table 2. Soil and groundwater samples collected during the site investigation activities were submitted to Heritage Laboratories, 7901 West Morris Street, Indianapolis, Indiana for analysis. Samples were analyzed for Benzene, Ethylbenzene, Toluene, and Total Xylenes (BETX) constituents utilizing SW846-8240B methodology, and Polynuclear Aromatics (PNA's) utilizing SW846-8310 methodology. In addition, one sample was submitted for Total and TCLP Lead analysis utilizing SW846-6010A methodology. A Summary of Laboratory Results for the soil samples are provided in Appendix 4, Table 3. A Summary of the Laboratory Results of the groundwater samples analyzed at the site is provided in Appendix 3, Table 4.

4.0 LIMITED REMEDIAL ACTION ACTIVITIES

In addition to performing an investigation, to define the extent of petroleum impacted soils and groundwater at the site, Heritage provided the necessary personnel and equipment to complete the removal of the UST system (steel product piping) and excavate petroleum impacted soils in the immediate area of the former UST System.

Based on the preliminary findings of the subsurface soil investigation performed at the site, the extent of petroleum impacted soils were determined to be limited to the immediate area south, west and north of the former UST system. In these areas, the impacted soils were excavated. The excavation of the petroleum impacted soils to the east of the former UST excavation were limited by the presence of a buried water line traversing in a north-south direction, an access road, and railroad tracks. It was also determined, that based upon the extent of the lateral migration of the petroleum constituents in the eastward direction (Appendix 1, Figure 8), the continued excavation of these soils was not appropriate without further evaluation of alternative remedial actions. As a result, extensive excavation of petroleum impacted soils was not performed to the east of the former UST location.

Groundwater was encountered at a depth of 7 to 8 feet below surface grade at the excavation, and as a result, excavation of impacted soils was not advanced to a depth greater than 8 feet below surface grade.

On September 27, 1997, Heritage commenced the excavation and removal of petroleum impacted soils from the former UST excavation and dispenser pipeline area. Soils were excavated to the south of the UST excavation to the extent practical. The removal of soils to the south was limited by the presence of a buried electrical power utility line and a buried stormwater drainage line. The wood shoring for the stormwater utility pipeline was partially exposed along the south face of the excavation; refer to Appendix 8, Photograph 11.

Soils were excavated to the west of the former UST excavation to within 9 feet of Building 1600A and to within 15 feet of the building along the former distribution piping trench, see Appendix 1, Figure 8.

Soils were excavated to the east of the former UST excavation to within 4 feet of a buried water line utility which ran in a north-south direction along the west side of the access roadway. The wood shoring for this utility pipeline was partially exposed along the west face of the excavation; refer to Appendix 8, Photograph 13.

Soils were excavated to the north of the former UST excavation along the former product dispenser distribution pipeline. Soil excavation proceeded northward along the pipelines, from surface grade to a depth of 7 feet below surface grade, until encountering the former product dispenser area.

Free product was not encountered during the excavation activities. Groundwater was encountered during the excavation activities at a depth of 7 to 8 feet below surface grade. Groundwater was in contact with petroleum impacted soils at the floor of the excavation. Groundwater encountered at the floor of the excavation did not exhibit a petroleum sheen in the area of the former USTs but did exhibit a petroleum sheen along the former dispenser pipeline trench. As a result of the large number of soil borings advanced at the site, and the soil samples collected from these soil borings which were submitted to a laboratory for BETX and/or PNA constituent analysis, additional soil samples were not collected from the limits of the completed UST excavation.

Excavated petroleum impacted soils were temporarily stockpiled at the north end of the site until off-site transportation arrangements were in place. An estimated 800 cubic yards of petroleum impacted soils were excavated and stockpiled at the site (estimated 400 cubic yards of impacted backfill and 400 cubic yards impacted native soil). The stockpiled soils were transported to the former Naval Fire-Fighter Training Facility (Building 3304), and included in a bio-remediation project being conducted at this location as approved by the IEPA. These soils were kept separate from the other soils being processed at the bio-remediation site.

The UST excavation was back-filled to 1 foot of surface grade utilizing imported 3–inch crushed limestone and brought to final grade with imported grade-8 crushed limestone. Applying a new asphalt surface cover over the excavation area completed surface restoration.

5.0 SITE CHARACTERISTICS

5.1 Site Geology

Results of the field observations made during the subsurface soil investigation indicated the geology of the site, to a depth of 16 feet below surface grade, consisted primary of three soil units. The upper soil unit, extending from surface grade to 6 feet below surface grade, was Silty-clay to Clayey-silt, brown to red-brown, moist, and contained cobbles, pebbles, and sand. A thin, sandy, deposit was encountered in this upper soil unit at boring B-14. The middle soil unit, extending from 6 feet to 12 feet below surface grade, was a Sandy-silt to Silty-sand, medium to fine grained, brown to light-brown, water saturated, and containing cobbles, pebbles, and thin clay lenses. The lower soil unit, extending from 12 feet below surface grade to the maximum depth of the investigation, was a Clayey-silt to Silty-clay, gray, massive to interbedded silt and clay, moist, with included pebbles, shells, and sand. The two lower units appeared to be lacustrine in origin; the upper unit was consistent with glacial till material.

One notable exception to the natural soils encountered during the site investigation, was the concrete, slag, and coal encountered in the area of boring B-29. These materials were apparently remnants from a reported former coal storage area that had been located in the area of B-29 and B-30. Based upon a 1943 base map a building was located over the area in which these borings were advanced. The concrete debris may be part of the foundation or footings of this WW II era building. The presence of the concrete at 2 to 3 feet inhibited the completion of some of the soil borings attempted in the area. The failed borings are noted in Appendix 1, Figure 3.

Free product was encountered at soil boring location B-17. This was observed by the accumulation of approximately 0.2-inch of free product at the top of the second soil sample tube (4-8' BSG) after removal of the soil sample tube from the boring. This soil boring was immediately back-filled to surface grade utilizing granular bentonite clay following collection of a soil sample for submittal to the laboratory for analysis of lead. Free product

was not observed in the soils collected from the surrounding soil borings B-14, B-15, B-20, and B-22, indicating the occurrence of free product, or petroleum saturated soils, may be limited in extent. As a result of the small area indicated to be impacted by petroleum-saturated soils and the depth below surface grade this saturated soils was encountered, additional activities associated with the removal of this observed free product was not initiated.

A soil core sample was collected from the Silty-sand soil unit for submittal to a geotechnical laboratory for analysis of moisture content, moist density, dry density, specific gravity, porosity, soil pH, and coefficient of permeability. The laboratory analysis was performed to provide information on the hydraulic characteristics of the groundwater-saturated zone. Laboratory results for the sample are provided in Appendix 9.

Reference to the Stack Unit Map of Northern Illinois identifies the surface geology at the site as part of the Lake Border Moraines of the Wadsworth Till Member of the Wedron Formation. The Wedron Formation generally consists of silty and clayey diamictons and occurs in thickness exceeding 20 feet. The Wedron Formation is predominately till with interbedded deposits of waterlaid gravel, sand and silt.

Immediately east of the site are occurrences of the Dolton member of the Equity Formation. The Dolton member is predominantly shore and shallow-water lake deposits of sand, pebbly-sand, gravelly-sand, and silt beds. These lacustrine deposits are generally less than 20 feet in thickness and overlie older Wedron Formation deposits.

Soils encountered at the site are consistent with the characteristics of the Wadsworth Till. In addition, some surface deposits, or soils, in the investigation area may have been the result of past surface-fill activities.

5.2 Site Hydrogeology

Groundwater was encountered at the site, and within the area covered by the investigation, at a depth of approximately 7 feet below surface grade. Groundwater was primarily contained within the silty-sand soil unit. Groundwater elevation measurements utilizing the piezometers installed at the site indicated the groundwater elevation was consistent with observed saturated soils as noted in the soil boring logs. This similarity in groundwater elevations between the soil borings and piezometer measurements indicate the groundwater aquifer encountered is unconfined.

Groundwater flow direction across the site was determined using groundwater elevation measurements recorded on October 10, 1997. The groundwater elevation measurements indicated groundwater flow at the site was in a east to southeast direction. The groundwater gradient at the site was calculated as 0.0037 foot/foot.

Reference to the Potential for Contamination of shallow Aquifers from Land Burial of Municipal Wastes Map (Berg & Kempton) indicates the site is located in an area characterized as E; Uniform, relatively impermeable silty or clayey till at least 50 feet thick and little evidence of interbedded sand or gravel. The site also borders an area to the west of the site that is characterized as A2; thick, permeable sand and gravel within 20 feet of surface. The A2 characterization is consistent with the field observation of the silty-sand encountered at depth at the site and as a result, is the characterization considered applicable to the site. Releases occurring in areas characterized as A2 are considered to pose a potential for groundwater contamination.

5.3 Hydrology

There are no surface water bodies within 100 feet of the former UST area. Buildings and an asphaltic covering typify the terrain surrounding the former UST area. Stormwater runoff from these areas is collected in catch basins located along the edge of the area and discharge into the stormwater sewer system of the Great Lakes Center. The storm sewer, which flows

west to east and is located south of the UST excavation, discharges to a shallow ditch along the railroad tracks.

5.4 Site Climatology

The following site climatological conditions were referenced from the Soil Survey of DuPage and Part of Cook Counties, Illinois (USDA), and Climate of Illinois (Climatography of the United States No. 60). In addition, temperature records for the Waukegan Area, which were available on-line through the Midwest Climate Center, were accessed and are summarized in Appendix 4, Table 6.

Generally, the climatological conditions of the site are typically continental, with cold and snowy winters and warm summers. As a result of the site's location, near Lake Michigan, local temperatures are cooler than surrounding inland-regions.

As a result of the generally flat terrain of the surrounding region and proximity to Lake Michigan (within one-mile), the site experiences a full sweep of winds. Generally, the southeast and easterly winds bring mild and wet weather, southwesterly winds bring rain showers and warm temperatures, westerly winds bring dry and moderate temperatures, and winds from the north are cool and dry.

In winter, the average temperature is 25°F and the average minimum temperature is 17°F. The average seasonal snowfall is 39 inches. The driest month of the year is usually February. The average frost line reaches 3 feet in depth in mid-winter.

In summer, the average temperature is 71°F and the average daily maximum temperature is 81°F. The average summer precipitation, April through September, is 22 inches. The wettest month of the year is usually May or June. The average relative humidity in mid-afternoon (spring and summer months) is 61 percent and can reach as high as 80 percent at dawn.

6.0 LOCAL GROUNDWATER WELLS

The Illinois Water Well Survey records for Public-Industrial-Commercial and Private Well Database records were searched for groundwater wells within a 2,500-foot radius of the site, which might potentially be impacted by the release. This search was conducted by utilizing the on-line Database Query available through the Illinois Water Well Survey. A records query was performed for both the Public-Industrial-Commercial and Private Well Database records for Sections 4, 5, 6, 7, 8, and 9, of Township 44 North, Range 12 East, and Sections 34, 35, and 36 of Township 45 North, Range 12 East. The results of the above records search for Public-Industrial-Commercial and Private Well Database records are provided in Appendix 10.

Review of the results of the Public-Industrial-Comrnercial Well Database Query indicated eight water well records were on file for the search area. Of these eight records, five records indicated the well status as inactive, two records indicated the well status as emergency use only, and one record indicated the well status as active. None of the Public-Industrial-Commercial Water Well's identified by the database query was located within a 2,500-foot radius of the site.

Review of the results of the Private Well Database Query indicated 44 water well records were on file for the search area. Of these 44 records, none were located within a 2,500-foot radius of the site. Refer to Appendix 1, Figure 7, for a site map identifying a 200-foot. and 2,500-foot. radius from the site.

7.0 DISCUSSION OF RESULTS

7.1 Site Soil Conditions

The soil sample laboratory results indicate the petroleum constituents detected in the soil samples were generally below the IEPA Tier 1 Site Remediation Objectives for the ingestion, inhalation and migration to groundwater routes of exposure for Industrial-Commercial Properties uses. With the exception of benzene, the soils meet the Tier 1 Residential Properties Remediation Objectives. The analytical data indicates that the soil samples collected at B-14 and B-20, within the railroad right-of-way, were the only sample locations where benzene was detected at concentrations above the Tier 1 Residential Remediation Objectives. In general, the submitted soil samples were collected from the soil borings at depths and distances that were anticipated to identify the limits of petroleum impact at the site. Based upon the field data, PID readings and field analysis, a limited remediation was conducted by Heritage. There are some soil sample locations, where soil samples collected at depth, meet the Tier 1 Site Remediation Objectives but, based upon the field data, the overlying soils at these locations may contain some residual contamination in excess of the Tier 1 Site Remediation Objectives. This area of potential contamination above the Tier 1 criteria is east of the excavated area.

As a result of the number of soil borings and soil samples collected from these soil borings at the site, specific soil samples were not collected from the actual limits of the UST and UST distribution piping excavation. Laboratory results from soil samples submitted from soil borings B-18 (8-9ft.), B-19 (6-7ft.), B-1 (7-8ft.), B-25 (3-4ft.), B-2 (10-11ft.), B-3 (5-6ft.), and B-8 (6-7ft.), which were located in close proximity to the limits of the UST excavation, indicated that suspected petroleum impacted soils to the south, west and north of the UST excavation were remediated, by excavation and removal, to the extent necessary to meet the IEPA Tier 1 Cleanup Criteria for Industrial-Commercial Properties. The soil samples collected from the soils underlying the product distribution piping, to a depth of 7 feet below surface grade (groundwater surface contact) in the area of soil borings B-5, B-6 (11-12ft.), and B-7 verify that the soils were

remediated, by excavation and removal, to the extent necessary to meet IEPA Tier 1 Cleanup Objectives for Industrial-Commercial Properties and Residential Properties. Based on the field analytical results (BETX and TVH) provided by IPS, soils at 1 to 2 feet below the groundwater surface (i.e. soils 7 to 9 feet below surface grade) that remained in place at the site in the area of soil borings B-5, B-6, and B-7, are considered to satisfy the IEPA Tier 1 Cleanup Criteria for Industrial-Commercial Properties.

Subsurface soils, east of the excavation limits of the UST dispenser piping trench, are considered to be impacted by residual petroleum constituents at concentrations above IEPA Tier 1 Cleanup Criteria for Industrial-Commercial and Residential Properties. The estimated limits of these residual contaminated soils, east of the excavated area, are based on visual observations during the soil boring activities, analytical results provided by IPS on-site analysis, and laboratory results from samples submitted to Heritage Laboratories.

The vertical thickness of the impacted soil decreases at increasing distances from the former dispenser pipeline. Near the former dispenser pipeline, the vertical thickness is estimated at 8 feet (2 to 10-ft. interval), of which approximately 4 feet extends below the groundwater table surface. Further east of the excavated area, the vertical thickness decreases from 6 feet (6 to12-ft. interval) to 4 feet (9 to 13 ft. interval), and to nearly 2 feet (10 to 13 ft. interval) near the estimated eastern limit of impacted soils. The lower 4 to 5 feet of these impacted soils are below the groundwater table surface. Impacted soils, which occur below the groundwater surface, are attributed to fluctuations in the elevation of the groundwater table surface over time (seasonal variations in elevation). Based on the site investigation activity, the estimated horizontal extent of impacted soils is shown in Appendix 1, Figure 8, and the vertical extent is shown in Appendix 1, Figure 6.

7.2 Site Groundwater Conditions

Groundwater was encountered at the site approximately 7 feet below surface grade and extending to depths greater than 10 feet BSG. Based upon the site geology the groundwater at the site is considered as a Class I Groundwater Resource.

Groundwater at the site occurs within a Silty-sand soil unit that has an estimated average vertical thickness of 6 feet. This water-saturated zone is considered an unconfined aquifer with limited vertical extent (5 to 6 feet of water saturation).

The Clayey-silts underlying the Silty-sand aquifer is anticipated to behave as a lower confining unit, or aquitard, for the above aquifer.

Groundwater samples were collected from the four piezometers installed at the site. As a result of poor groundwater recovery at piezometers P-1 and P-4, only sufficient sample volume for BETX analysis was collected. Sufficient sample volume was collected from piezometers P-2 and P-3 for both BETX and PNA analysis. The groundwater sample laboratory results indicate that BETX and PNA petroleum constituents are below the IEPA Tier 1 Cleanup Criteria for Class I groundwater resources with the exception of the samples collected from piezometer P-3 and P-4. Specifically, the laboratory results from this groundwater samples reveal Benzene at concentrations of 0.3 mg/L and 0.009 mg/L, which are above the Class I Groundwater Cleanup Criteria of 0.005 mg/L. All other analytical constituents reported for these samples were below the Class I Groundwater Cleanup Criteria.

Water level measurements performed at the site, utilizing the installed piezometers, indicate that the groundwater flow direction across the site is generally to the east towards Lake Michigan. Based on the groundwater surface contours, derived from the water level measurements, a groundwater surface gradient of 3.57×10^{-3} ft/ft was calculated. Utilizing

the hydraulic conductivity results from the submitted soil core sample collected at soil boring B-20 of 1.09 x 10^{-4} cm/sec (3.58 x 10^{-6} ft/sec) groundwater flow velocity was estimated at 3.32 x 10^{-3} ft/day.

8.0 CONCLUSIONS

Based upon the site investigative and remedial activities, a 45-Day Report and Site Classification Report are hereby submitted, see Appendix 12. The estimated extent of petroleum contaminated soils and groundwater at the site is shown in Appendix 1, Figure 8. Within these areas of contamination, the shallow groundwater has been the apparent mechanism for the migration of contaminants from the UST area. The groundwater flow direction at the time of the investigation was to the southeast. The estimated contaminant plume indicates a more easterly direction of movement. This difference at this time may be the result of several factors. The groundwater flow direction may fluctuate seasonally; the contaminants are moving through more transmissive zones (i.e., sand seams on a easterly direction rather than the southeast); and/or the presence of the building and location of the piezometers may also be influencing the movement of groundwater in this area. The vertical extent of soil contamination decreases in thickness as distance increases from the UST excavation area. At the eastern limit of the UST excavation, the estimated thickness of contaminated soil is 6 feet. The thickness of contaminated soil decreases to less than 2 feet in thickness at the eastern most extent of contamination.

The site is classified as high priority primarily because contamination was detected off-site (railroad property) and the presence of free product in the subsurface soils at soil boring B-17. Free product recovery and submittal of the Free Product Removal Report should be initiated as soon as possible.

Within the area of the former USTs, several potential migration pathways were identified including a waterline and storm sewer. However, the water table elevation is beneath the invert elevations of the waterline and storm sewer. Therefore, based upon the site hydrogeology, these utility lines are not considered to be a migration pathway.

After completing early corrective action measures, there is no apparent evidence that through natural or man-made pathways, migration of petroleum vapors threaten human health and safety or could cause explosions in basements, crawl spaces, utility conduits, storm or sanitary sewers, vaults or other confined spaces.

Class III special resource groundwater is not located within 200 feet of the excavation. Surface bodies of water have not been adversely affected by the release. Groundwater quality standards have been exceeded at the site's eastern property boundary (bordering railroad property).

Based upon the well survey, see Appendix 10, there are no potable water wells within the 200 or 2,500-foot radii of the site. The site is not located within the minimum, maximum, or regulated recharge area of a potable water supply well. The site geology is consistent with the A2 characterization in the Illinois State Geological Survey Circular 532. Physical soil classification results are included in Appendix 9. The Navy does not utilize any groundwater wells for potable water supply.

9.0 RECOMMENDATIONS

Heritage recommends that five monitoring wells be installed at the site to verify the extent and magnitude of the petroleum contamination. Possible locations are shown in Appendix 1, Figure 8. In addition, a recovery well should be installed in the vicinity of B-17 to facilitate recovery of the free product observed in this area. The wells should be constructed of stainless steel materials with the screened intervals varying from 5 to 10 feet, dependent upon the specific location (refer to cross sections in Appendix 1, Figure 6. The wells can be used to perform slug and/or pump tests to further evaluate the hydraulic conductivity of the aquifer materials.

Free product recovery should be started as soon as the recovery well is installed. Initial product recovery methods utilized may be passive or active, depending on the quantity of product exhibited in the recovery well. A Free Product Removal Report should be submitted to the IEPA as soon as practical.

With the additional information collected through the installation of a recovery well and monitoring wells, a remediation action plan can be developed to address the remaining soil and groundwater contamination at the site. Remedial technologies which would be evaluated include conventional groundwater recovery and treatment, and in-situ technologies including air sparging, soil vapor extraction, bioremediation or a combination of one or more of these technologies. IEPA and the US Navy will determine which of the recommended remedial technologies is best suited and most economical.

Field Analytical Results

PROJECT: Great Lakes Naval Training Center
N. Chicago, IL
Purchase Order 79419

CLIENT: Heritage Environmental Services
15330 Canal Bank Road
Lemont, IL 60439

SAMPLE DATE: September 24 - 30, 1997

REPORT DATE: October 1, 1997

REPORT NUMBER: 9709167

This report summarizes soil sampling activities along with on-site analyses at the above-referenced site. Discreet soil samples were obtained by hydraulically pushing and hammering specially designed soil sampler tubes to the desired depth. A plunger assembly, within the soil tubes, was disengaged at sampling depth to facilitate soil collection.

The static headspace method was utilized for all on-site soil analyses. All vapor samples were directly injected into a Shimadzu GC-14A and specific contaminant concentrations were calculated by a Shimadzu CR-4A computer integrator using a flame ionization detector (FID). A total of forty-eight (48) samples were analyzed for benzene, toluene, ethylbenzene, total xylenes (BTEX) and Total Volatile Hydrocarbons (TVH). Proven laboratory procedures were employed for quality assurance/quality control, including periodic blanks and calibration standards, resulting in a total of ninety-two (92) analyses.

The static headspace method utilized is a proven method for field screening of volatile organic compounds. Although at times results may prove similar to other laboratory methods, they may also prove to differ. The analytical procedure is one which provides a rapid screening for the targeted compounds with reproducible results.

Mr. Kevin Crandall of Heritage Environmental Services was present to direct sampling activities and acquired samples for additional off-site laboratory analysis.

Upon reviewing the following results, please do not hesitate to call with any questions. Thank you for choosing Innovative Probing Solutions for your project.

Laboratory Certificates - Soil Samples

Illinois Environmental Protection Agency
Leaking Underground Storage Tank Program
Laboratory Certification for Chemical Analysis

(SOIL INVESTIGATION SAMPLES)

A. Site Identification

IEMA Incident # (6 digit): _____ IEPA Generator # (10 digit): _____

Site Name: NAVY PUBLIC WORKS CENTER, Bldg. 1600A, RAY STREET

Site Address (Not a P.O. Box): NAVAL TRAINING CENTER

City: GREAT LAKES, IL 60088 County: LAKE

B. Sample Collector

I certify that:

1. Appropriate sampling equipment/methods were utilized to obtain representative samples. KJC (initial)
2. Chain of custody procedures were followed in the field. KJC (initial)
3. Sample integrity was maintained by proper preservation. KJC (initial)
4. All samples were properly labeled. KJC (initial)

C. Laboratory Representative

I certify that:

1. Proper chain of custody procedures were followed as documented on the chain of custody forms. CLS (initial)
2. Sample integrity was maintained by proper preservation. CLS (initial)
3. All samples were properly labeled. CLS (initial)
4. Quality assurance/quality control procedures were established and carried out. CLS (initial)

5. Sample holding times were not exceeded. CLS (initial)

6. SW-846 Analytical Laboratory Procedure (USEPA) methods were used for the analyses. CLS (initial)

D. Signatures

I hereby affirm that all information contained in this form is true and accurate to the best of my knowledge and belief. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Laboratory Certificates - Groundwater Samples

Illinois Environmental Protection Agency
Leaking Underground Storage Tank Program
Laboratory Certification for Chemical Analysis
(groundwater Samples)

A. Site Identification

IEMA Incident # (6 digit): _____ IEPA Generator # (10 digit): _____

Site Name: NAVY Public Works Center, Bldg. 1600A, RAY Street

Site Address (Not a P.O. Box): NAVAL TRAINING Center

City: GREAT LAKES, IL 60088 County: LAKE

B. Sample Collector

I certify that:

1. Appropriate sampling equipment/methods were utilized to obtain representative samples. KJC (initial)
2. Chain of custody procedures were followed in the field. KJC (initial)
3. Sample integrity was maintained by proper preservation. KJC (initial)
4. All samples were properly labeled. KJC (initial)

C. Laboratory Representative

I certify that:

1. Proper chain of custody procedures were followed as documented on the chain of custody forms. (initial)
2. Sample integrity was maintained by proper preservation. (initial)
3. All samples were properly labeled. (initial)
4. Quality assurance/quality control procedures were established and carried out. (initial)

5. Sample holding times were not exceeded. CLS (initial)

6. SW-846 Analytical Laboratory Procedure (USEPA) methods were used for the analyses. CLS (initial)

D. Signatures

I hereby affirm that all information contained in this form is true and accurate to the best of my knowledge and belief. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

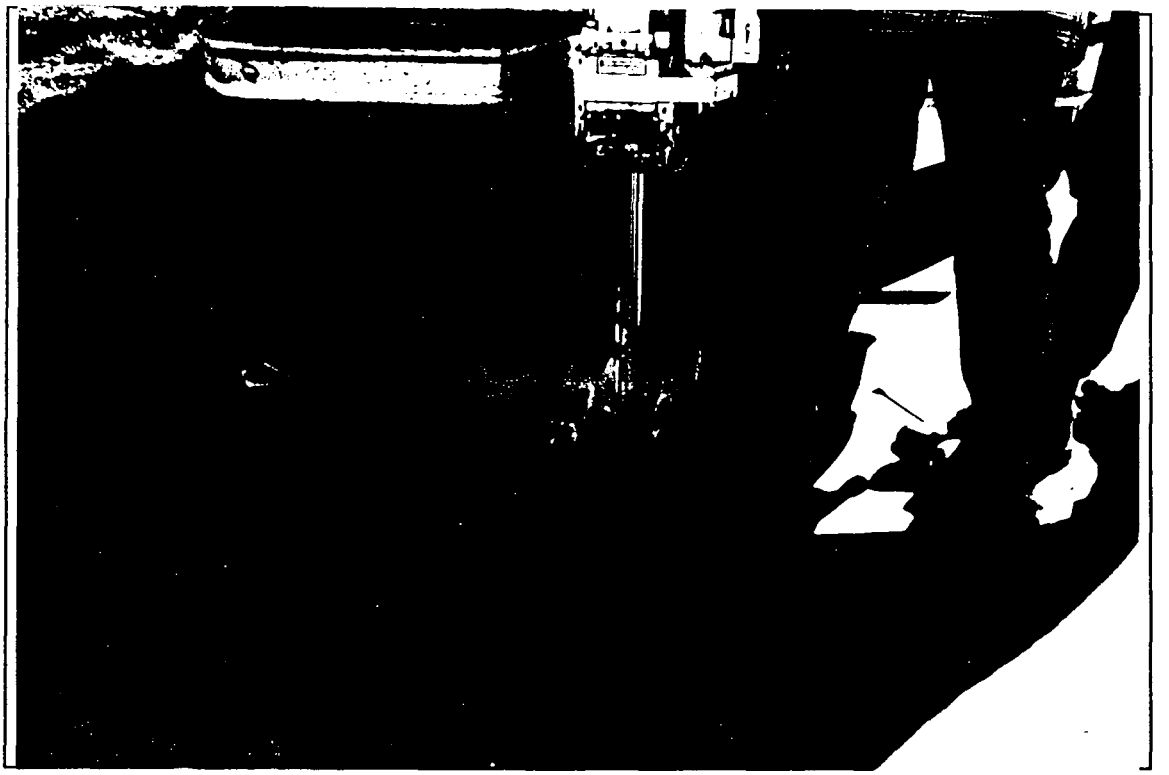
APPENDIX 8

Photographs

PHOTOGRAPH 1 (ABOVE): View of soil boring locations along east side of Building 1600A (red flags).

PHOTOGRAPH 2 (BELOW): View of soil boring locations east of fenceline and west of railroad tracks (red flags).

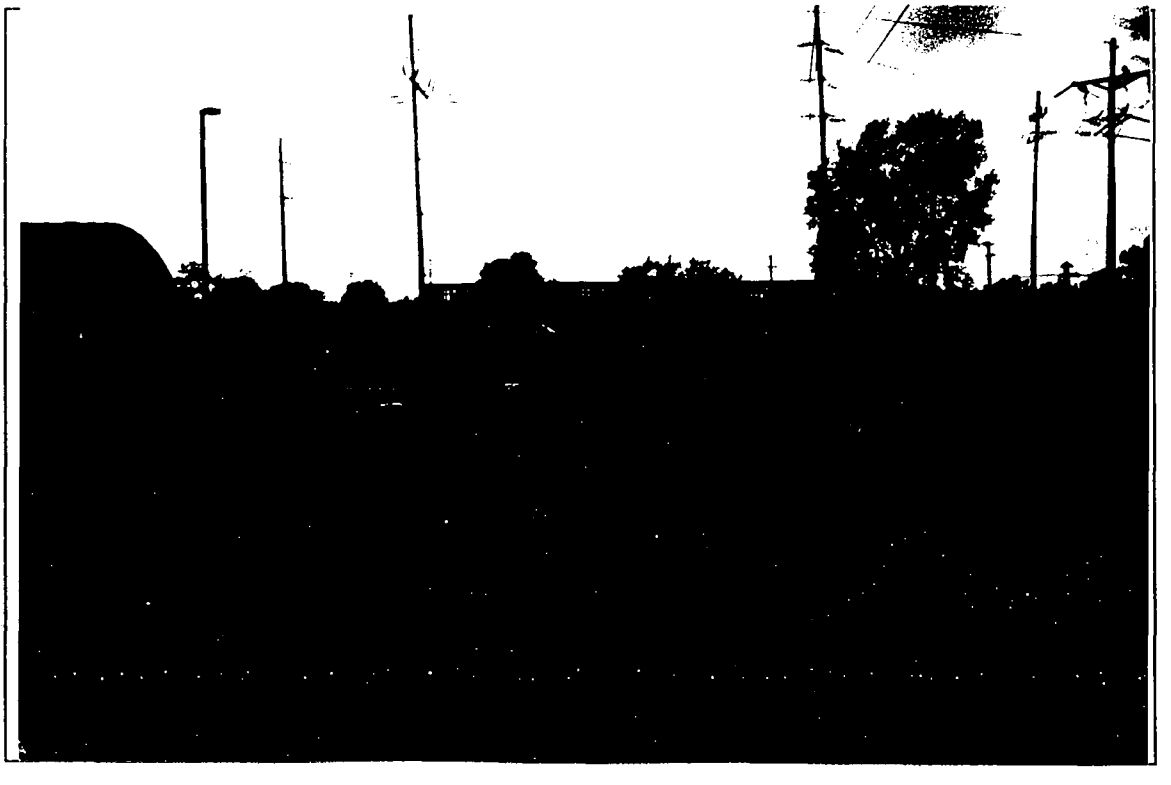


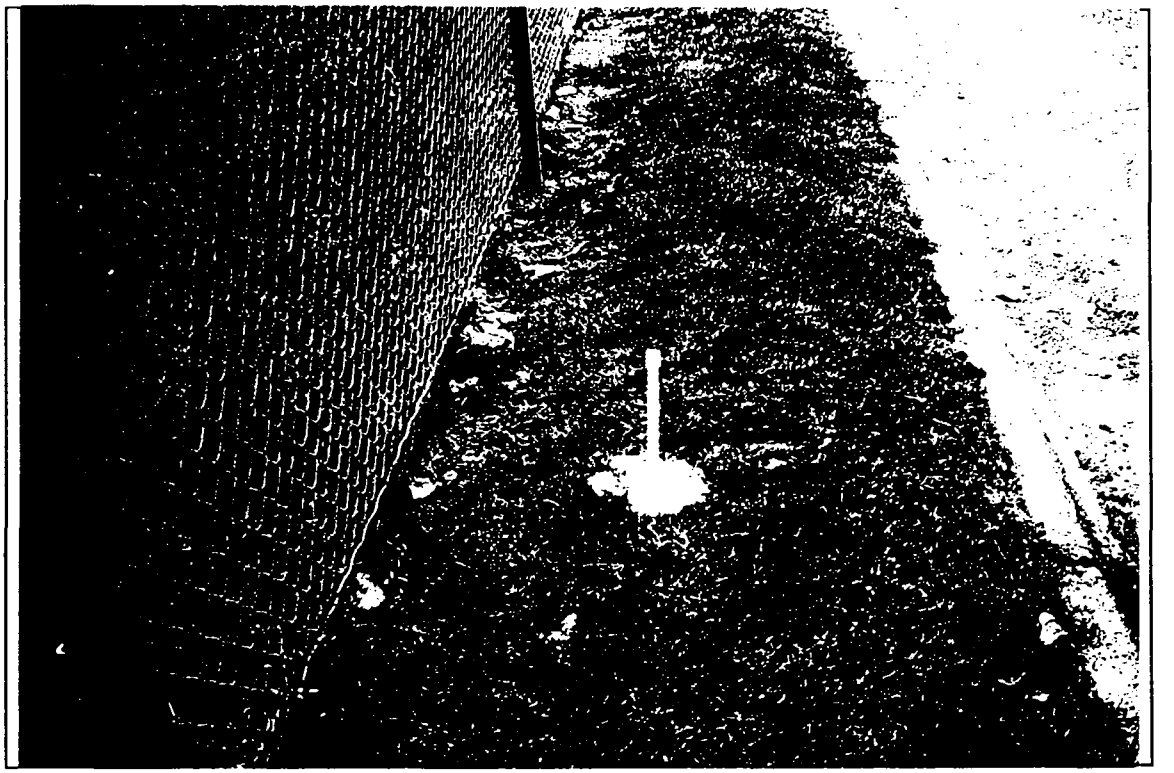
PHOTOGRAPH 3 (ABOVE): View of hydraulic push soil sampling equipment in operation.

PHOTOGRAPH 4 (BELOW): View of soil sample tube during removal from soil boring.

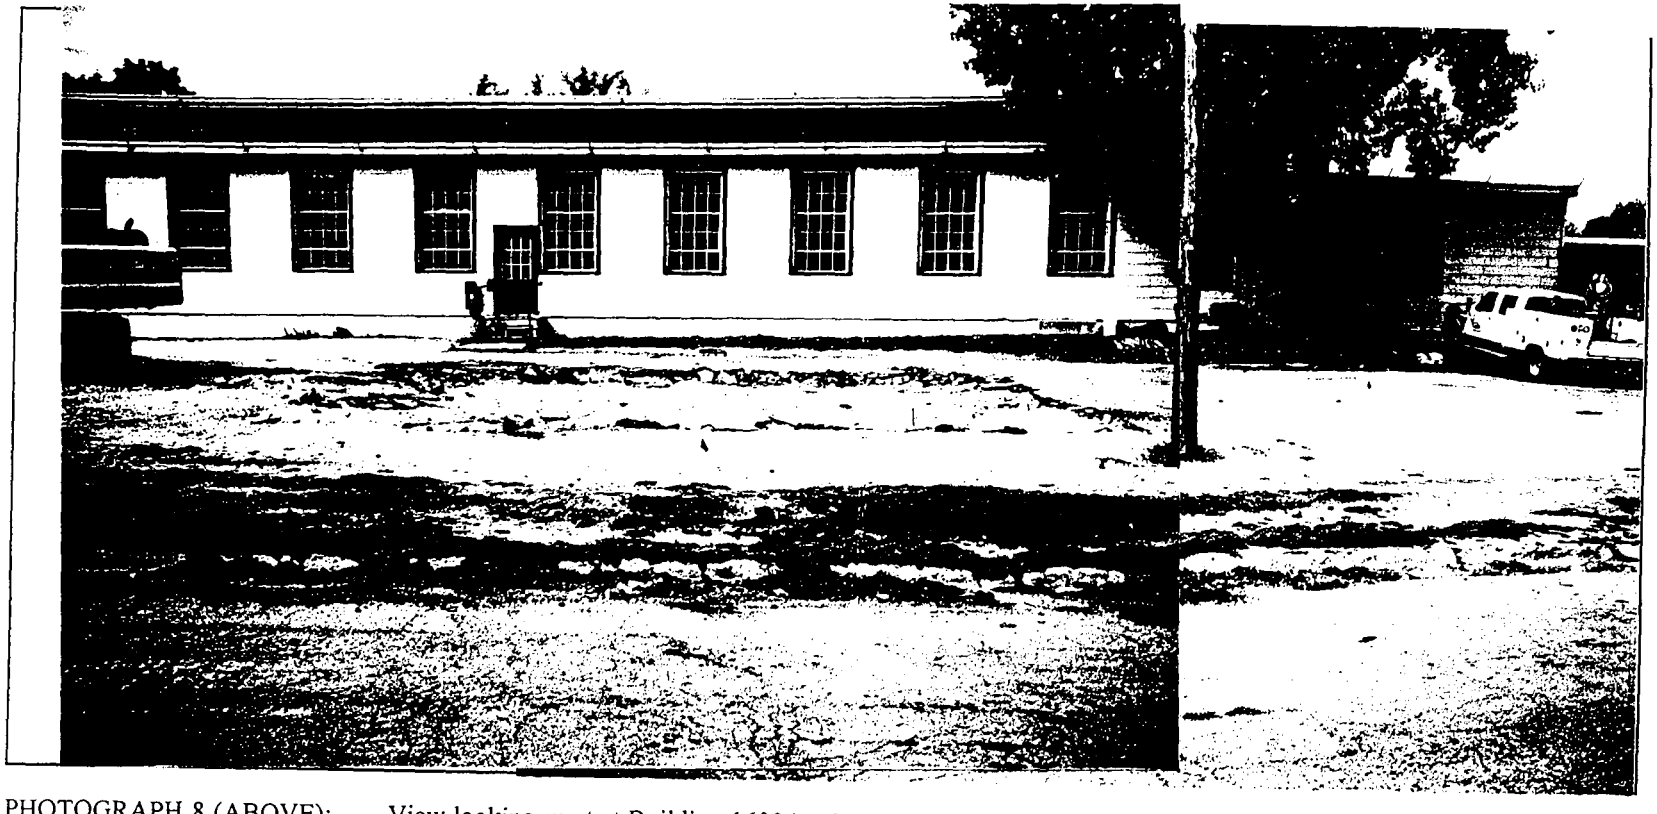
PHOTOGRAPH 5 (ABOVE): View of soil boring locations east of railroad tracks (Building 1600A can be seen in background).

PHOTOGRAPH 6 (BELOW) View from soil boring at far east end of investigation limit. Building 1600A can be seen in background.

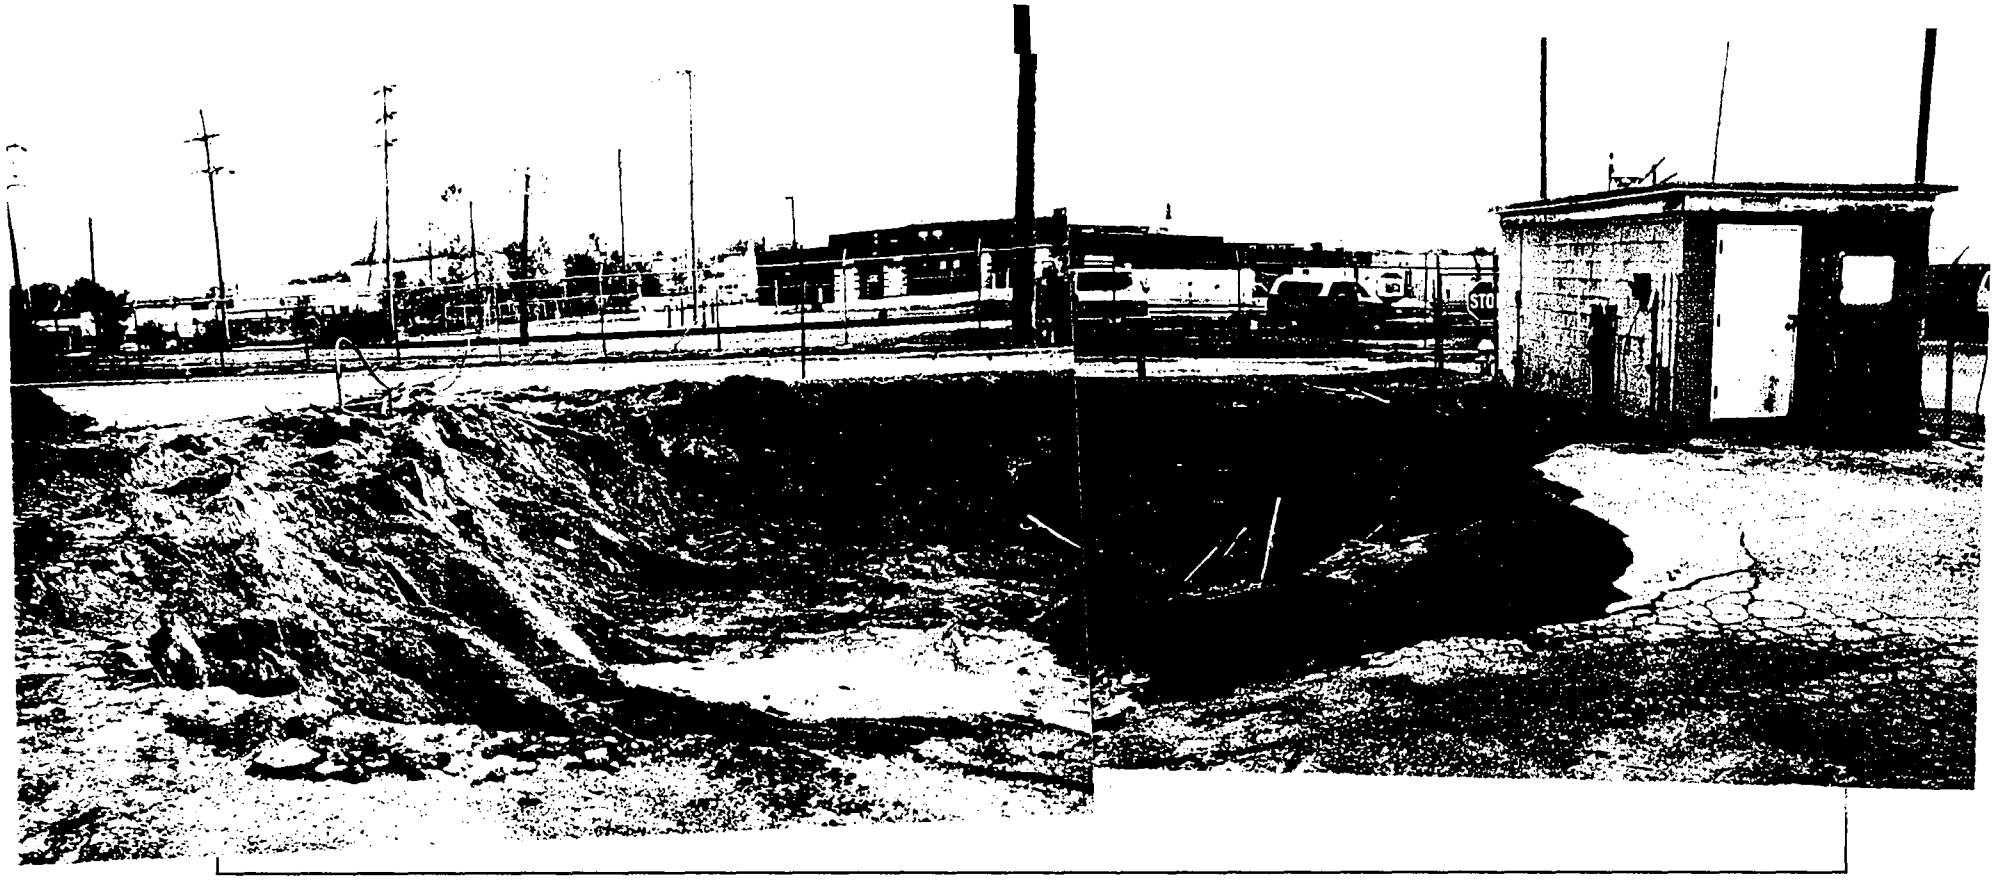




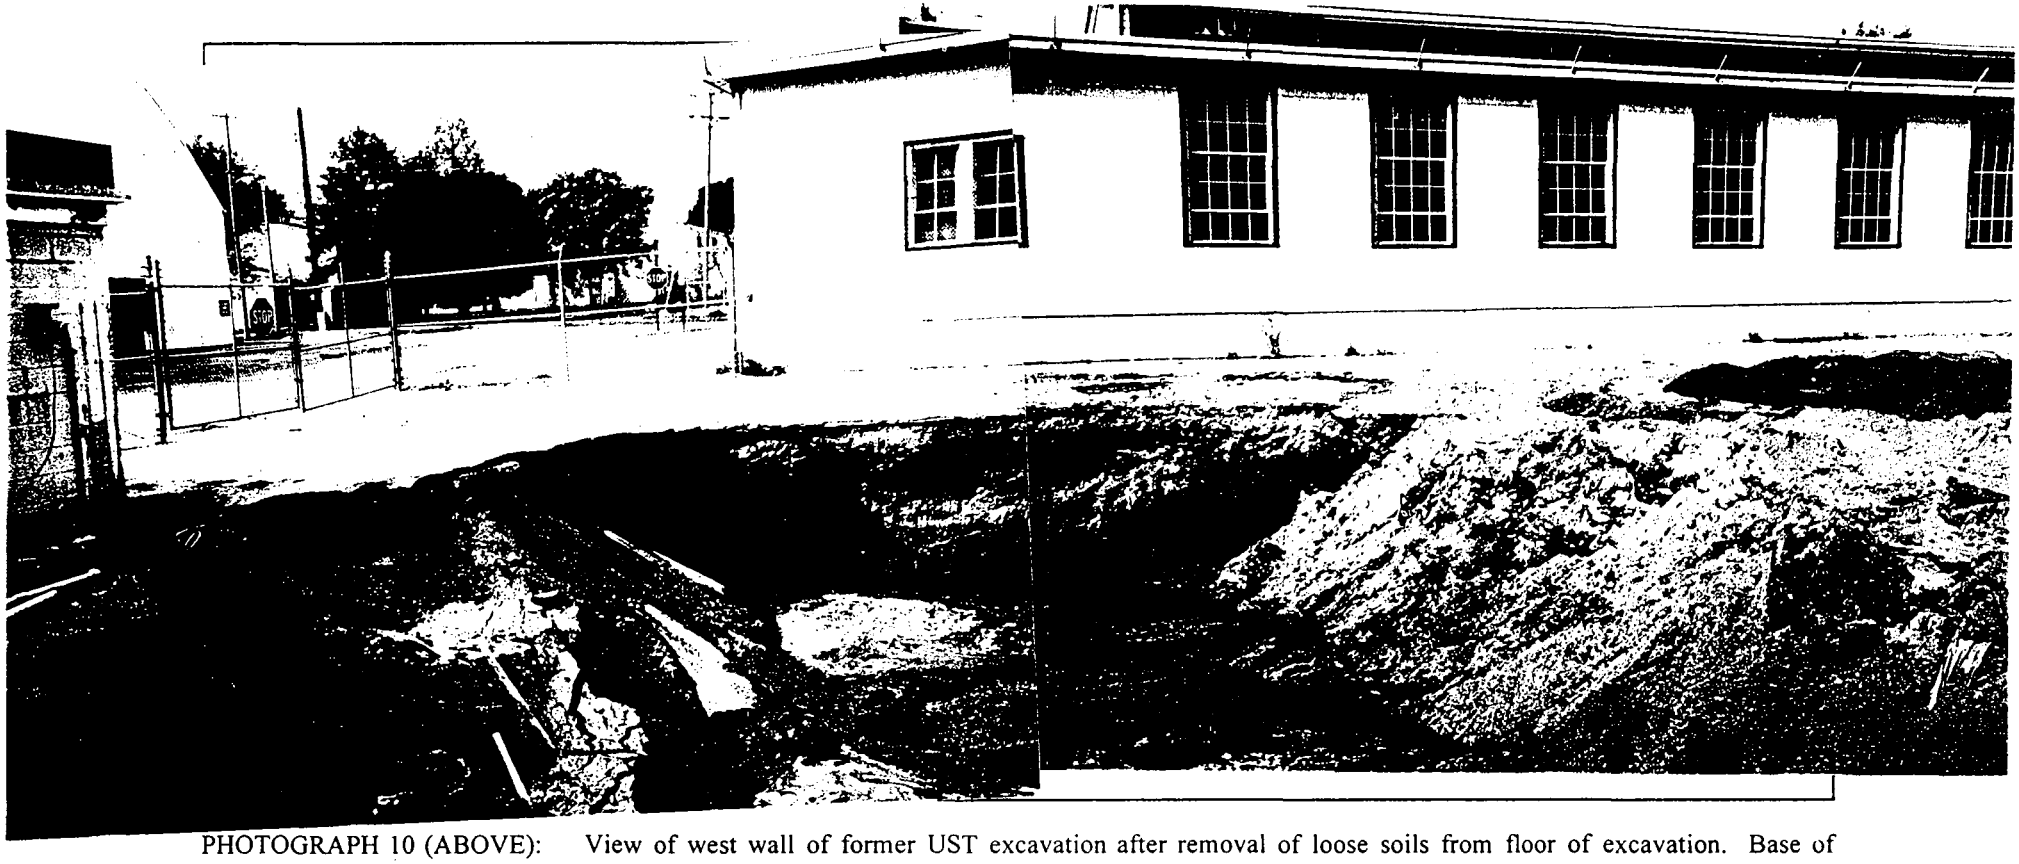
PHOTOGRAPH 7 (ABOVE): Typical view of piezometer installed at site.



PHOTOGRAPH 8 (ABOVE): View looking west at Building 1600A. Former fuel dispenser island area was located in area of surface excavation (center of photo).



PHOTOGRAPH 9 (ABOVE): View looking east at east wall of former UST location. View after removal of loose soils from floor of UST excavation area. IPC van can be seen in background performing soil borings east of fenceline.



PHOTOGRAPH 10 (ABOVE): View of west wall of former UST excavation after removal of loose soils from floor of excavation. Base of excavation is at local water table surface elevation.

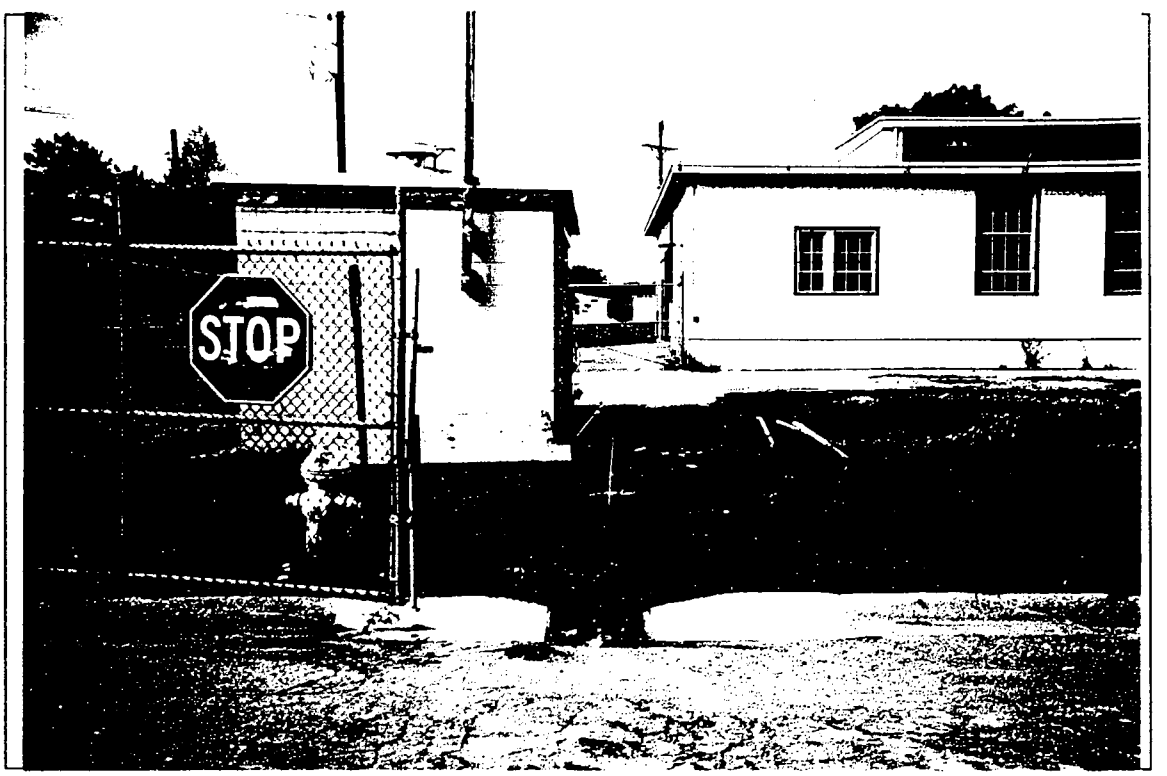
PHOTOGRAPH 11 (ABOVE): View of wooden shoring along south wall of UST excavation area (left of center). Flagging marks stormwater utility location.

PHOTOGRAPH 12 (BELOW): View looking north along east wall of UST excavation and along buried water utility (blue flagging).

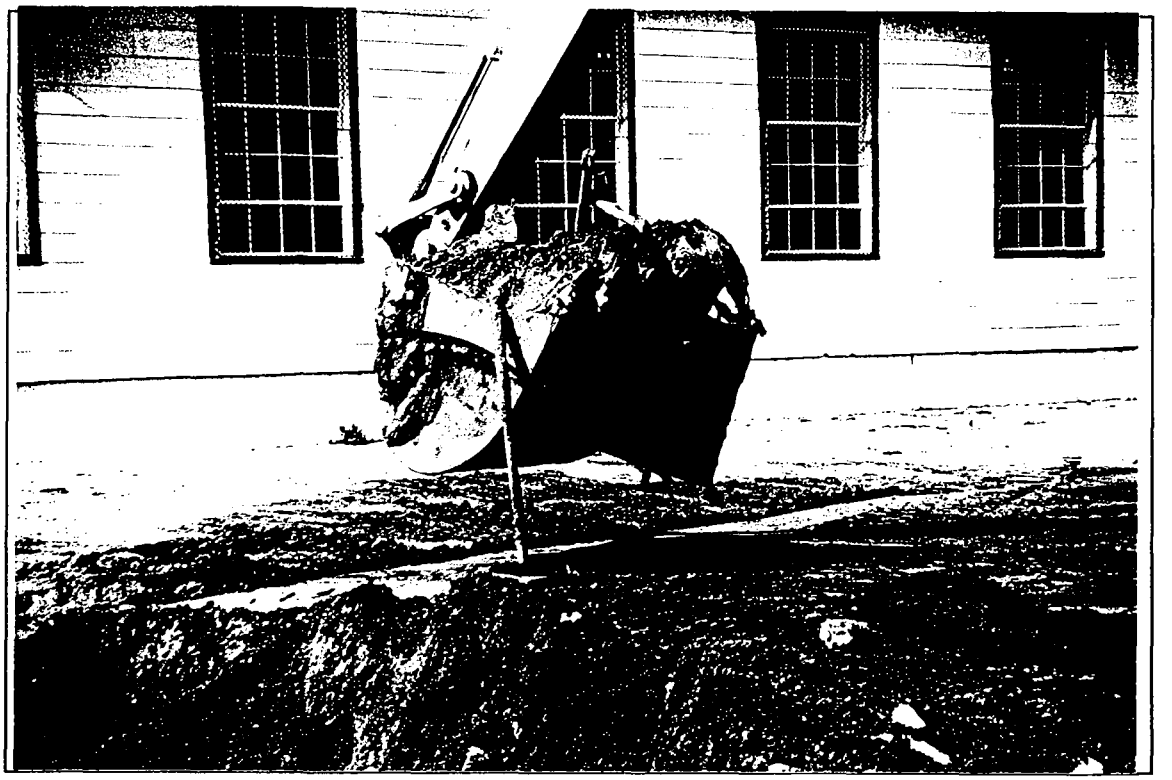
PHOTOGRAPH 13 (ABOVE): View of east wall of former UST excavation area during removal of petroleum impacted soil. Wood shoring for water utility can be seen at left.

PHOTOGRAPH 14 (ABOVE): View looking west at south end of Building 1600A. Stormwater drain (outfall) can be seen in lower foreground.

PHOTOGRAPH 15 (BELOW): Close up view of stormwater utility near excavation area.

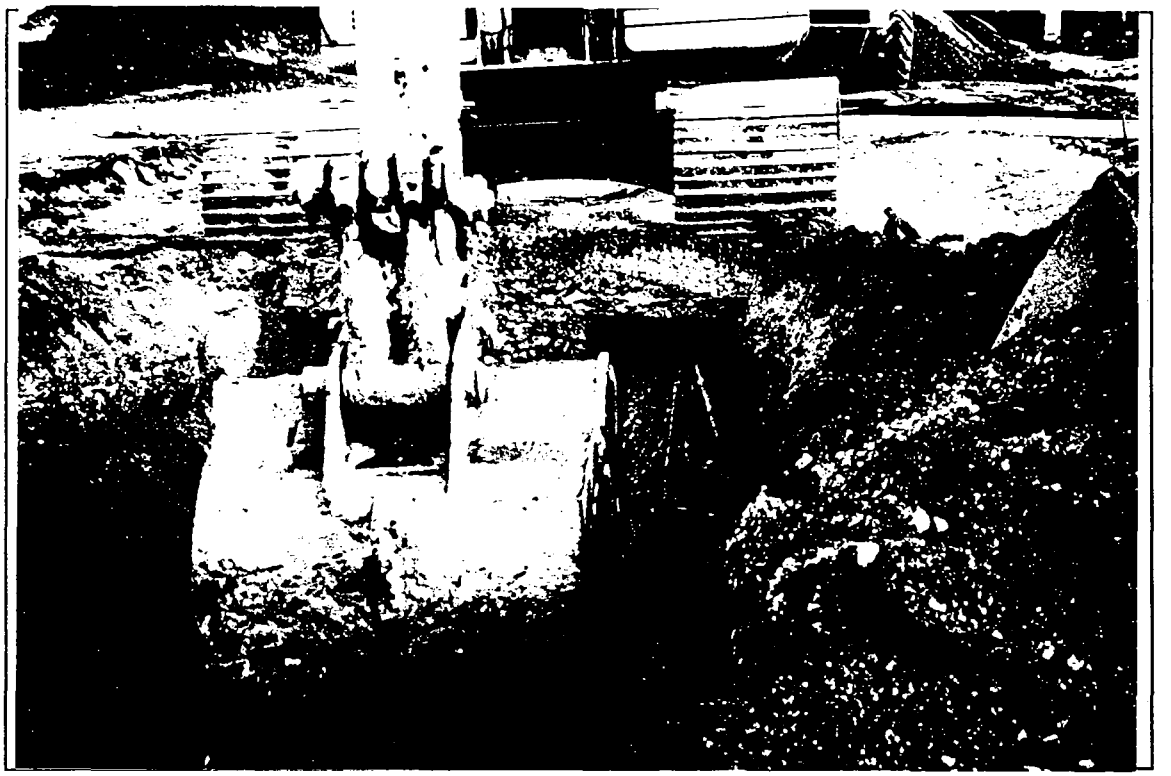


PHOTOGRAPH 16 (ABOVE): View looking north at north wall of UST removal area. Excavation of soils from former dispenser pipeline trench area underway in background.



PHOTOGRAPH 17 (ABOVE): View of oil 55 gallon steel drum removed from former UST excavation area.

PHOTOGRAPH 18 (BELOW): View of oil (foundation?) concrete wall encountered during excavation of west dispenser pipeline run. View is looking west at west wall of excavation trench.



PHOTOGRAPH 19 (ABOVE): View of west pipeline trench excavation near completion at north end of former dispenser location.

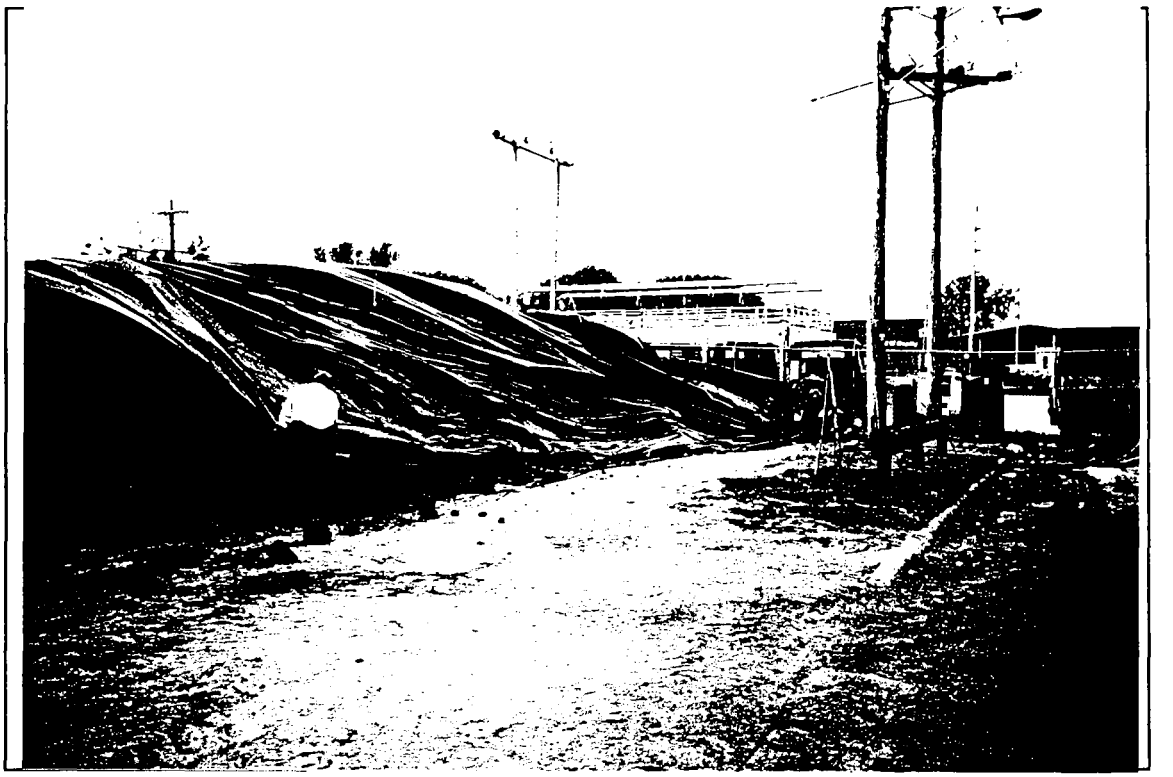
PHOTOGRAPH 20 (BELOW): View of pipeline excavation at east dispenser piping trench. Completed west dispenser piping trench can be seen at left.

PHOTOGRAPH 21 (ABOVE): View of dispenser piping concrete pad.

PHOTOGRAPH 22 (BELOW): View of dispenser piping trench after completion of soil and piping removal. Center soil island was collapsed into trench in preparation of placement of stone backfill.

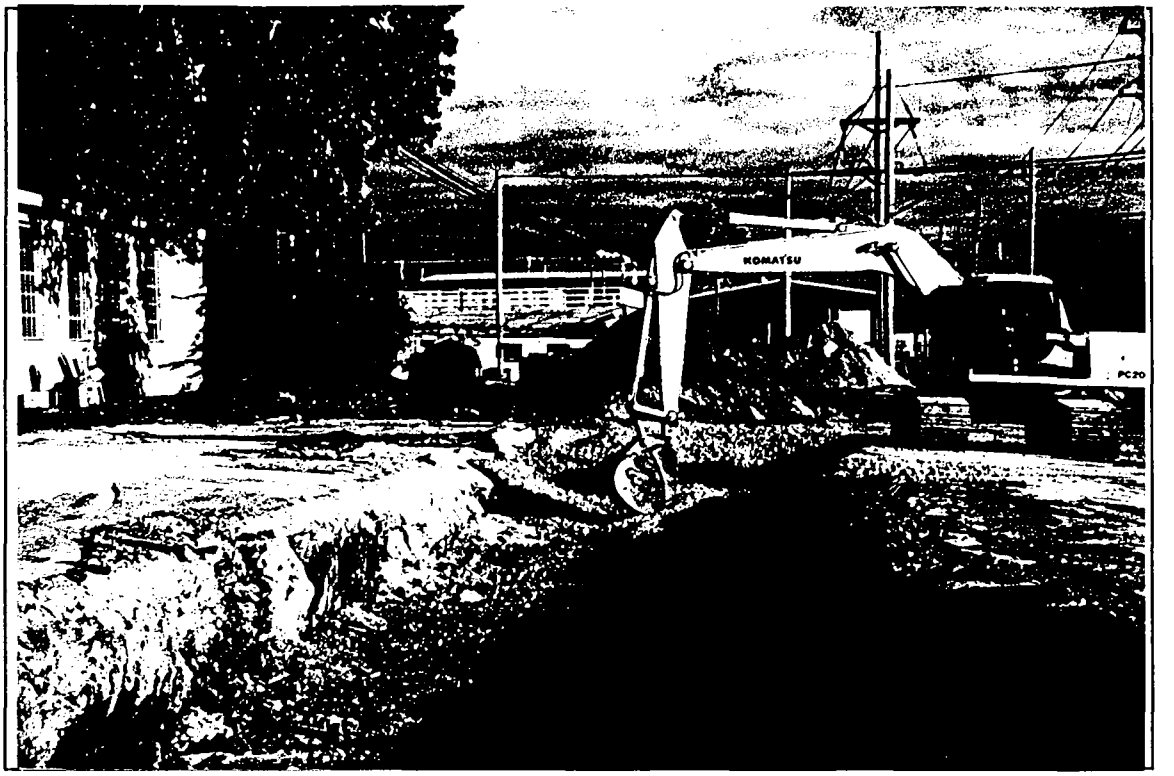
PHOTOGRAPH 23 (ABOVE): View of plastic pad utilized for placement of excavated soils from former UST area.

PHOTOGRAPH 24 (BELOW): View of front end loader moving excavated soils from excavation area to stockpile area. Red flags identify locations of soil borings and piezometers.



PHOTOGRAPH 25 (ABOVE): View of placement of overnight cover on stockpiled soil.

PHOTOGRAPH 26 (BELOW): Additional view of soil stockpile.



PHOTOGRAPH 27 (ABOVE): View of backfill stone placement.

PHOTOGRAPH 28 (BELOW): Additional view of backfill stone placement. Three inch rock was utilized to within 1 foot of surface. Final grade was established with Grade 8 stone material.

APPENDIX 11

UST Removal Documentation

OFFICE OF THE ILLINOIS STATE FIRE MARSHAL
Division of Petroleum and Chemical Safety
1035 Stevenson Drive
Springfield, Illinois 62703-4259
(217)785-1020 or (217)785-5878

RECEIVED
AUG 04 1997
DIV. OF PETROLEUM & CHEMICAL SAFETY

FOR OFFICE USE ONLY
Facility # 2023810
Permit # 2120-97 REM

APPLICATION for Permit for REMOVAL of Underground Storage Tanks. (Please type or print clearly)

(1) OWNER OF TANKS - Corporation, partnership, or other business entity: (Must be mailing address)

Naval Training Center, Great Lakes
Name
2703 Sheridan Rd., Suite 120
Street Address
Great Lakes IL 60088
City State Zip
Carlo L. Luciano 847-688-6375
Contact Person Phone

(2) FACILITY - Facility ID # _____
(Name and address where tanks are located:)

Naval Training Center, Public Works Center Bldg. #1600A
Name
1600 Ray St. (Ste DC Bldg. 1-A)
Street Address
Great Lakes IL 60088 Lake
City State Zip County
Carlo Luciano 847-687-6375
Contact Person Phone

(3) TANK(S): Fill in the appropriate blanks for the tank(s) to be removed. Attach additional sheet(s) if more space is needed.

# of Tanks	Capacity in gallons	Product to be stored	Date tank last used	# of Tanks	Capacity in gallons	Product to be stored	Date tank last used
1	10,000	gasoline	8/1/97				
1	10,000	gasoline	8/1/97				
1	6,500	diesel	8/1/97				

(4) CONTAMINATED SITE (complete this section for sites where a release has been reported). Reminder: Releases or suspected releases must be reported to IEMA at (800)782-7860 within 24 hours:

IEMA Incident # _____

(5) CONTRACTOR: I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that all information submitted is true, accurate and complete.

R. W. Collins Co.
Company Name
7225 West 66th Street
Address
Chicago IL 60638
City State Zip
708-458-6868 708-458-6870
Telephone # Fax #
IL IL772 2/9/98
Contractor License # Expiration Date
Ann H. Collins Corp. Sect.
Name of Authorized Representative Title or Position
Ann H. Collins 8/1/97
Signature Date

FOR OFFICE USE ONLY

After receiving an approved permit, the Contractor the permit was issued to or an employee of that contractor (this does not include a subcontractor) shall establish a date certain to perform the UST activity by contacting the Office of the State Fire Marshal, Division of Petroleum and Chemical Safety, by telephone at the Springfield office at (217)785-1020 or (217)785-5878 between 8:30 a.m. and 12:00 p.m., at which time a mutually agreed upon date and time for the UST activity shall be scheduled. THIS PERMIT IS VALID FOR SIX MONTHS FROM THE APPROVAL DATE.

Permission to remove underground storage tank(s) is hereby granted. Such removal shall not commence until 9-4-97.
A seventy-two hour (3 working day) notice to this office is required to confirm final date of removal for our Inspector to be on site.

8-6-97 W. Dale Tanke
Approval Date Approved

Ladies and Gentlemen:

This is to inform your office that Tank No's 12M-T-1, 12M-T-2, and 12M-T-3 were been removed on Sept. 17, 1997. The tank removal was overseen by a representative from your office, Mr. George Pinkowski.

Point of Contact for this office is Carlo Luciano at (847) 688-5999, X-50.

Sincerely,

MARK SCHULTZ
Head, Environmental Department
By direction of
the Commanding Officer

Springfield, IL 62794-9276

Ladies and Gentlemen:

SUBJECT: NAVAL TRAINING CENTER, GREAT LAKES, BLDG. #1600A
INCIDENT # 971739

Attached is the 20 Day Certification for Leaking Underground Storage Tank (LUST) for the subject building.

During removal of the USTs 12M-T-1, 12M-T-2, and 12M-T-3 on 17 Sep 97, the tanks were all found to be in good condition and not leaking. Soil from the excavation was contaminated with petroleum. Later, it was discovered that the piping runs between the tanks and the dispensing area leaked causing the contamination. This Command is in the process of preparing the 45 Day and Corrective Action reports for this site.

Point of Contact for this office is Carlo Luciano at (847) 688-5999 x-50.

Sincerely,

Mark Schultz

MARK SCHULTZ
Head, Environmental Department

the Commanding Officer

Illinois Environmental Protection Agency
Leaking Underground Storage Tank Program
20 Day Certification

A. Site Identification

IEMA Incident # (6 digit): 971739 IEPA Generator # (10 digit): 0971255004

Site Name: Bldg. 1600A

Site Address (Not a P.O. Box): Naval Training Center Great Lakes

City: Great Lakes County: Lake

B. Certification

1. I am/we are the owner and operator of the underground storage tank system(s) from which a release was reported under the IEMA incident correctly identified above;

2. As much of the regulated substance as necessary to prevent further release to the environment has been removed;

3. There has been a visual inspection of any above ground releases or exposed below ground releases;

4. Further migration of the released substance into surrounding soils and groundwater has been prevented;

5. Monitoring of any fire and safety hazards posed by vapors or free product that have migrated from the UST excavation zone and entered subsurface structures (such as sewers or basements) will continue;

6. Hazards posed by contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement or corrective action activities have been remedied;

7. If the treatment remedies included treatment or disposal of soils, the owner/operator has complied with 35 Ill. Adm. Code Parts 722, 724, 725, and 807 through 815;

8. Measurement for the presence of a release has been conducted where contamination was most likely to be present at the UST site;

9. In selecting sample types, sample locations and measurement methods, the nature of the stored substance, type of backfill, depth to groundwater and other factors as appropriate for identifying the presence and source of the release have been considered;

10. The investigations to determine the possible presence of free product, and begin free product removal as soon as possible, if applicable, in accordance with 35 Ill. Adm. Code Section 731.164 or 732.203:

APPENDIX 12

Site Classification Completion Report
And
45-Day Report

Illinois Environmental Protection Agency
Leaking Underground Storage Tank Program
Site Classification Completion Report

A. Site Identification

IEMA Incident # (6 digit): 971739 IEPA Generator # (10 digit): 0971255004

Site Name: United States Navy, Great Lakes Training Center

Site Address (Not a P.O. Box): Building 1600 A, Ray Street

City: Great Lakes County: Lake

B. Site Information

1. Is this an amended report? Yes___ No_X_

2. Has a Site Classification Work Plan been approved? Yes___ No_X_
   Date of approval letter: _____

C. Site Classification Summary

1. This site is classified as:

NO FURTHER ACTION	_____	(applies to methods 1, 2 and pathway exclusion)
LOW PRIORITY	_____	(applies to methods 1 and 2 only)
HIGH PRIORITY	X	(applies to methods 1, 2 and pathway exclusion)

2. The method of site classification used was:

Method 1	X	
Method 2	_____	
Exposure Pathway Exclusion	_____	(proceed to Section J)

D. Site Classification by Methods 1 or 2

1. Is the UST(s) system located within the minimum or maximum setback zone or regulated recharge area of a potable water supply well? Yes___ No_X_

2. After completing Early Action measures, is there evidence that through natural or man-made pathways, migration of petroleum or vapors threaten human health or human safety or could cause explosions in basements, crawl spaces, utility conduits, storm or sanitary sewers, vaults or other confined spaces present or in the past? Yes___ No_X_

3. Is Class III Special Resource Groundwater located within 200 feet of the excavation? Yes___ No_X_

4. After completing Early Action measures, has a surface body of water been adversely affected (i.e. visible sheen, free product layer) by a release from an UST system? Yes___ No_X_

5. Has a groundwater quality standard or groundwater objective for any applicable indicator contaminant been exceeded at the property boundary line or 200 feet from the UST excavation, whichever is less? Yes_X_ No___

6. If Method One was chosen, indicate the rating, as described in the Illinois State Geological Survey Circular 532, with which the actual site geology is consistent. A2

7. If Method Two was chosen, answer the following questions regarding the first 15 feet of native material (below the invert elevation of the UST):

   a. Did the material contain unconsolidated sand, gravel, and/or sand and gravel that is 5 feet or more in thickness with 12 percent or less fines? Yes___ No___
   b. Did the material contain sandstone 10 feet or more in thickness, or fractured carbonate 15 feet or more in thickness? Yes___ No___
   c. Is the material capable of the following:

      i. sustaining a groundwater yield, from a 12 inch borehole, of 150 gallons per day or more from a thickness of 15 feet or less? Yes___ No___
      ii. does the material have a hydraulic conductivity of 1×10^{-4} cm/sec or greater? Yes___ No___

E. Site Evaluation

1. Physical Soil Classification:

   Provide the following:

   a. Soil borings

      1. A list of publications reviewed and preliminary conclusions concerning the site geology;
      2. Soil boring logs;
      3. A site map to scale and oriented north showing:

         a. Soil boring locations;
         b. UST system(s);
         c. 200 foot radius from UST system;
         d. Property boundaries.

   b. Method 1 soil properties test results (include calculations, methodologies, and complete laboratory reports)

      1. Soil particle analysis;

2. Soil moisture content;
3. Soil classification;
4. Unconfined compression test;
5. In-situ hydraulic conductivity; **OR**
6. Ex-situ hydraulic conductivity.

c. Method 2 soil properties test results (include calculations, methodologies, and complete laboratory reports)

1. Soil particle analysis;
2. Ex-situ hydraulic conductivity; **OR**
3. In-situ hydraulic conductivity and yield of geologic material.

2. Groundwater Investigation

Provide the following:

a. A discussion of how the monitoring well configuration provides the greatest likelihood of detecting migration of groundwater contamination;
b. Monitoring well construction diagrams;
c. A table showing static water elevations;
d. Sample collection shipment and preservation information;
e. Completed chain-of-custody form(s);
f. Copies of laboratory reports (include field and lab blanks);
g. Analytical results in tabular format;
h. A site map to scale and oriented north showing:

i. Monitoring well locations;
ii. Potentiometric surface map;
iii. Groundwater flow direction;
iv. 200 foot radius from UST system;
v. Property boundaries.

F. Water Well Survey

Provide the following:

1. The results of the survey conducted to identify all community water supply wells within 2,500 feet of the UST system and all potable water supply wells within 200 feet of the UST system (include copies of well logs and all correspondence to and from the Illinois State Water Survey and the Illinois State Geological Survey).

2. The local units of government contacted to determine if there is a local ordinance or policy regulating the usage of potable water supply wells.

3. A site map to scale showing all of the community water supply wells within 2,500 feet of the UST system and all potable water supply wells within 1,000 feet of the UST system (radii of 200, 400, 1,000 and 2,500 feet from the UST system should be marked on the map).

4. A table indicating the setback zone for each community or potable water supply well and the distance from the UST system to the well (the location of each well must be identified on the map by numbers corresponding to information provided in the table).

5. The sources consulted in determining whether the UST system is within the regulated recharge area of any community or potable water supply well.

G. Migration Pathways

Provide the following:

1. A discussion of the investigation conducted to identify all potential natural and man-made migration pathways that are on the site, rights-of-way attached to the site, or in any area surrounding the site that may be adversely affected as a result of a release of petroleum from the UST system.

2. A discussion of further investigations conducted to determine if there is evidence that migration of petroleum or vapors along such pathways threatens human health or the environment or may cause explosions in basements, crawl spaces, utility conduits, storm or sanitary sewers, vaults or other confined spaces.

3 A discussion of the findings based on the investigations performed.

4. A site map to scale and oriented north showing:

   a. The UST system(s) and excavation;
   b. Product and dispenser lines;
   c. Potential natural and man-made pathways on-site, in rights-of-way attached to the site or in areas that may be adversely affected by the release;
   d. Soil boring locations;
   e. Property boundaries.

H. Class III Special Resource Groundwater

Provide the following:

1. A discussion of the steps taken to determine if Class III groundwater exists within 200 feet of the site.

2. A site map to scale and oriented north showing:

   a. Location of Class III groundwater;
   b. Radius of 200 feet from the UST system(s).

I. Surface Bodies of Water

Provide the following:

1. A discussion of the steps taken to locate all surface bodies of water on site and within 100 feet of the site, and once located, the steps taken to determine if they have been adversely affected by the presence of a sheen or free product layer resulting from a release of petroleum from the UST system.

2. A site map to scale and oriented north showing the locations of the surface bodies of water on site and within 100 feet of the site.

J. Classification by Exposure Pathway Exclusion

1. Extent of contamination exceeding Tier 1 objectives

   Provide the following:

   a. A table showing the analytical results and depth of samples;
   b. A site map showing the soil sample location points and groundwater monitoring well locations;
   c. A site map showing the extent of soil and/or groundwater contamination exceeding Tier objectives;
   d. A cross-section of the site showing the areas of soil contamination exceeding Tier 1 objectives;

2. Physical soil characteristics

   Provide the results of the tests performed to determine the following:

   a. Whether or not the concentration of any organic contaminants exceeded the attenuation capacity of the soil.
   b. Whether or not the organic contaminants exceeded the soil saturation limit.
   c. Whether or not the soils exhibited any characteristics of reactivity for hazardous waste.
   d. The pH of the soils.
   e. Whether or not contaminated soils exhibited any characteristics of toxicity for hazardous waste.

3. Inhalation exposure route

   Demonstrate the following:

   a. An institutional control is in place that requires safety precautions for construction worker populations and compliance with (b) below.
   b. That any contaminant of concern within ten (10) feet of the land surface or within ten (10) feet of any man-made pathway does not exceed Tier 1 cleanup objective or that an Agency-approved engineered barrier is in place.

4. Ingestion exposure route

   Demonstrate the following:

   a. An institutional control is in place that requires safety precautions for construction worker populations and compliance with (b) below.
   b. That any contaminant of concern within three (3) feet of the land surface does not exceed the Tier 1 cleanup objectives or an Agency-approved engineer barrier is in place.

5. Groundwater ingestion exposure route

   Demonstrate the following:

   a. The source of the release is not located within the minimum or maximum setback zone or regulated recharge area of a potable water supply well.
   b. Any area within 2,500 feet from the source of the release is restricted under a local ordinance which prohibits the use of groundwater as a potable supply.
   c. The concentration of any contaminant of concern in groundwater within the minimum or maximum setback zone of a potable water supply well will meet the applicable Tier 1 cleanup objective.
   d. The concentration of any contaminant of concern in groundwater discharging into a surface water will meet the applicable surface water quality standard per 35 IAC Section 302.

K. Supporting Documentation

Provide the following:

1. A site map to scale and oriented north showing:

   a. UST system(s) and excavation;
   b. Product and dispenser lines;
   c. Pumps and islands;
   d. Underground utilities (sewer, gas, water, etc.);
   e. Nearby structures (buildings, roads, etc.);
   f. Location of the soil boring(s);
   g. Location of the monitoring wells;
   h. Property boundaries;
   i. 200 foot radius from the UST System(s).

2. A horizontal cross section showing the various geologic units and the depth to groundwater.

3. Laboratory Certification(s).

L. Signatures

I certify under penalty of law that this report, supporting documents and all attachments were prepared under my direction or supervision. To the best of my knowledge and belief, this report, supporting documents and all attachments are true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

M. Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision. I also certify under penalty of law that the classification for this site is ☐ No Further Action ☐ Low Priority ☒ High Priority and that this classification satisfies all the requirements of 35 Illinois Administrative Code Part 732, Subpart C. In addition, I certify that there ☐ **is** ☒ **is no** evidence that, through natural or man-made pathways, migration of petroleum or vapors threaten human health or human safety or may cause explosions in basements, crawl spaces, utility conduits, storm or sanitary sewers, vaults or other confined spaces. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signature:

Date: May 8, 1998

Illinois Environmental Protection Agency
Leaking Underground Storage Tank Program
45 Day Report

A. Site Identification

IEMA Incident # (6 digit): 971739 IEPA Generator # (10 digit): 0971255004

Site Name: Building 1600A

Site Address (Not a P.O. Box): Naval Training Center Great Lakes

City: Great Lakes County: Lake

B. Release Information

1. Will the owner/operator seek reimbursement from the Underground Storage Tank Fund? Yes___ No X

2. Identify the material(s) released: gasoline

3. The material(s) released was (check all that apply):

   a. Petroleum X
   b. Nonpetroleum ___

4. Is this report intended to serve as theCorrective Action Completion Report? Yes___ No X

C. Early Action

1. What was the volume of backfill material excavated? ≈400 yds^3

2. What was the volume of native soil excavated? ≈400 yds^3

3. Was groundwater encountered at the site? Yes X No___

4. Did the groundwater exhibit a sheen? Yes X No___

5. Was free product encountered? Yes X No___
   If Yes, the owner/operator must submit a free product removal report.

D. Site Information

Provide the following:

1. Data on the nature and estimated quantity of the release; Refer to Report Sections 7 and 8.

2. Data from available sources or site investigations concerning the following factors:

   a. Surrounding populations;
   b. Water quality;
   c. Use and approximate locations of wells potentially affected by the release;
   d. Subsurface soil conditions;
   e. Location of subsurface sewers;
   f. Climatological conditions;
   g. Land use.

   Refer to Report Sections 1, 5, 7 and 8.

3. A discussion of what was done to measure for the presence of a release where contamination was most likely to be present at the UST site; Refer to Report Sections 2, 3, 5 and 7.

4. The results of the free product investigations; Refer to Report Sections 7, 8 and 9.

5. A discussion of the action taken to prevent further release of the regulated substance into the environment; Refer to Report Section 4.

6. A discussion of the action taken to mitigate fire and safety hazards posed by vapors or free product that has migrated from the UST excavation zone and entered subsurface structures; Refer to Report Section 4.

7. Any other information collected while performing initial abatement measures pursuant to 35 Ill. Adm. Code Section 731.162 or 732.202(b). Refer to report.

E. Supporting Documentation

Provide the following:

1. Site map to scale and oriented north showing: Refer to Report Appendix 1.

   a. UST(s) system(s) and excavation limits;
   b. Product and dispenser lines;
   c. Pumps and islands;
   d. Underground utilities (sewer, gas, water, etc.);
   e. Nearby structures (buildings, roads, etc.);
   f. Soil boring(s) (if present);
   g. Monitoring well(s) and/or sumps (if present);
   h. Property boundaries;
   i. Sample location points;

2. An area map showing the site in relation to surrounding properties. This map should identify the facilities on the surrounding properties; Refer to Report Appendix 1.

3. A cross section, to scale, with dimensions showing the UST(s) and the excavation; Refer to Report Appendix 1.

4. Analytical/screening results in tabular format; Refer to Report Appendix 3.

5. UST(s) information in a tabular format and that at a minimum includes: Refer to Report Section 1 and Appendix 11.
   a. The total number of UST(s) on site;
   b. The volume of the UST(s) (in gallons);
   c. The material stored in the UST(s);
   d. Identification of UST system(s) that had a release;
   e. Identification of UST system(s) that were repaired, removed, or abandoned-in-place.

6. A copy of the Office of the State Fire Marshal Permit for Removal, Abandonment-in-Place or other OSFM permits or notifications; Refer to Report Appendix 11.

7. A narrative of tank removal and cleaning operations; describe how wastes generated during the tank removal were managed, treated, and disposed; Refer to Report Section 1, Appendix 11.

8. Photographs of UST removal activities and the excavation; Refer to Report Section 1, Appendix 11.

9. Copies of manifests for soil and groundwater transported off-site. Refer to Report Appendix 11. Soils transported to the FFTU for bio-remediation were transported without a manifest, under a bill of lading. Refer to Appendix 13.

F. Signatures

I certify under penalty of law that this report, supporting documents and all attachments were prepared under my direction or supervision. To the best of my knowledge and belief, this report, supporting documents and all attachments are true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Subj: CERTIFICATION OF NON-HAZARDOUS, NON-SPECIAL WASTE FOR PETROLEUM CONTAMINATED SOIL AT BUILDING 1600A; PURSUANT TO SECTION 808 OF ILLINOIS ADMINISTRATIVE CODE TITLE 35

Dear Mr. Harrison:

Naval Training Center (NTC), Great Lakes, Illinois is certifying through this letter that the proposed waste described within enclosure (1) does not meet the criteria for a hazardous waste (toxicity, corrosivity, iginitability and reactivity), is not a liquid waste, does not contain asbestos, polychlorinated biphenyl's (PCBs) or auto fluff.

Generated waste is a result of a leaking underground storage tank (UST) removal project. The underground storage tanks were utilized throughout their service life to contain only petroleum products (gasoline and #2 diesel fuel). Petroleum product from the UST's has leaked from the tanks and/or piping over their service life and contaminated the surrounding soil.

Provided in enclosure (1) are site and vicinity maps, drawings, historical data and analytical results to verify that the subject waste can be characterized as ordinary municipal waste pursuant to 35 IAC Section 808 are also included.

The waste (soil) is to be transported to the old Firefighting Training Unit (FFTU) site within Willow Glen golf course. This property is also Federal/Navy property and is being used as a biopile site for passive bioremediation of petroleum contaminated soils, such as the subject waste. Approximately 700 cubic yards (CY) of petroleum contaminated soil will be transported from Building 1600A to the FFTU site for bioremediation.

Subj: CERTIFICATION OF NON-HAZARDOUS, NON-SPECIAL WASTE FOR PETROLEUM CONTAMINATED SOIL AT BUILDING 1600A; PURSUANT TO SECTION 808 OF ILLINOIS ADMINISTRATIVE CODE TITLE 35

Please contact Mr. Terry Aide or J.P. Messier at (847) 688-5999 extension 44 or 51, respectively if there is any additional information you may want on this matter.

Sincerely,

MARK SCHULTZ
Environmental Officer

POINT PAPER

JP Messier/Terry Aide
N45/(847) 688-5999
3 Oct 97

Subj: Buildings 11, 103 and 1600A - Petroleum Impacted Soil Disposal Certification Pursuant to the Illinois Environmental Protection Act and 35 IAC Section 808

BACKGROUND

A recent Amendment passed August 19, 1997 to the Illinois Environmental Protection Act allows for the disposal of pollution prevention waste as a municipal landfill waste as long as it has been proven to be a non-hazardous solid waste.

The intent of this point paper is to act as the certifying document for disposal of pollution prevention waste created as a result of release from underground petroleum-containing storage tanks at Buildings 11, 103 and 1600A on the Naval Training Center, Great Lakes, Illinois.

HISTORY AND DISCUSSION

Building 11 is the Navy Public Works Center power plant. Part of its operation utilized a MUSE backup generator with a 2,000 gallon fiberglass diesel UST. Last year, a new generator and AST rendered the MUSE generator and tank obsolete. The UST is scheduled to be removed on October 7-8, 1997. Petroleum contamination may be encountered in the area when the tank is removed.

Building 103 served as the Great Lakes Gas Station during the first half of the century. A historical photograph from 1939 shows cars being fueled at the station (enclosed). The gasoline station was shut down many years ago and there were no records showing the tanks being removed. A magnetometer survey and interviews with older employees verified the existence of three (3) underground gasoline tanks (approx. 10,000 gallons each), one (1) diesel heating tank (approx. 12,500 gallons) and one (1) kerosene tank (approx. 1,000 gallons). Results of the survey are enclosed. These USTs are scheduled to be removed on October 7-8, 1997. Petroleum contamination is expected to be encountered when these tanks are removed.

The Building 1600A Gas Station served as the gas station for the Navy Public Works Center, Great Lakes until August, 1997. It contained two (2) underground gasoline storage tanks (10,000 gallons each) and one (1) underground diesel tank (6,500 gallons). When the tanks and fuel dispensers were recently removed, petroleum contamination was found throughout the area.

Subj: Buildings 11, 103 and 1600A - Petroleum Impacted Soil Disposal Certification Pursuant to the Illinois Environmental Protection Act and 35 IAC Section 808

ACTION

The Great Lakes Environmental Department certifies that only petroleum products (gasoline, diesel and kerosene) were stored in the underground tanks at these sites. All tanks and piping (fuel, vent and electrical) will be excavated and removed from these sites along with concrete, asphalt and other debris. Petroleum contaminated soils will be removed until cleanup objectives are met or until structures not slated for demolition have the potential to be impacted.

A composite soil characterization sample will be collected from areas of visibly stained soils at each site. Each composite sample will consist of samples taken from observed contaminated regions from each of the following: One from each tank wall (four total), two from the tank floor, and one for every ten feet of piping run. All samples will be collected and analyzed utilizing the sampling, custody and analytical procedures outlined in the Fire Fighting Training Unit (FFTU) Quality Assurance Project Plan (QAPP), written by Beling Consultants (August 1997).

An analysis for petroleum contaminated soils from the building 1600A site is enclosed. The composite sample was taken using the procedures referenced above. Results show that the soil is neither a hazardous waste or a special waste. Composite samples from both the building 103 and 11 sites will be analyzed for BTEX, PNA/PAH in addition to the same items shown on the building 1600A analysis. Petroleum contaminated soil from these sites do not meet the criteria for a hazardous waste, is not a liquid waste, does not contain asbestos, polychlorinated biphenyl's (PCBs) or auto fluff. If the analysis verifies that the petroleum contaminated soils are neither hazardous or a special waste, the soil will then be taken to the FFTU site within Willow Glen golf course. This property is also Federal/Navy property and is being used as a biopile site for passive bioremediation of petroleum contaminated soils.

Petroleum contaminated soils will be placed directly in transport trucks for transport over to the FFTU site at building 3304. Each load will be internally documented with a bill of lading that includes a description of the location where soil was removed from each site. Excavated soil will be stockpiled and segregated at the FFTU for biopile construction.

Biopiles will be constructed in accordance with the Fire Fighting Training Unit (FFTU) Revised Workplan for Excavation of Drainage Piping, and Field Pilot Study for Bioremediation of Petroleum Contaminated Soil, written by Beling Consultants (July, 1997).

Subj: Buildings 11, 103 and 1600A - Petroleum Impacted Soil Disposal Certification Pursuant to the Illinois Environmental Protection Act and 35 IAC Section 808

Operation and Maintenance of the biopiles to track progress toward compliance with the Tiered Approach to Corrective Action Objectives (TACO) standards found in 35 IAC 742 will also be done in accordance with the Fire Fighting Training Unit (FFTU) Revised Workplan for Excavation of Drainage Piping, and Field Pilot Study for Bioremediation of Petroleum Contaminated Soil, written by Beling Consultants (July, 1997).

RECOMMENDATIONS AND CONCLUSIONS

All soil pursuant to the excavation at buildings 11, 103 and 1600A will be certified as both a non-hazardous and non-special waste in accordance with requirements set forth by the Illinois Environmental Protection Act. This will be fully proven by laboratory analysis of the waste stream for all of the RCRA hazardous constituents (toxicity, ignitibility, reactibility and corrosivity).
