Ginny,

Thank you for this comment. You are correct, there was a mistake on Figure 8, the sediment flow chart. The text is correct and will not be changed; the flow chart has been revised (see attached) and will be replaced in the final version. To be clear, the samples will not be homogenized. I hope this helps. Please let us know if you have any further comments.

Thanks,

Maritza-

One minor comment on the Draft Final RI WP:

It appears that the text on page WS-14-10 conflicts with the second step for surficial sediment on the sediment flow chart Figure 8. Figure 8 indicates that sediment subsamples for benthic invertebrate community analysis will be homogenized, whereas the supporting text suggests that it will not be. It appears that the Navy is correctly identifying (in text) that the intent is to minimize disruption of the sediment for the benthic evaluation by not homogenizing this portion of the sample.

Please clarify.
