F-18 Crash Site
Site Assessment Report

1.0 INTRODUCTION

1.1 BACKGROUND

The United States Navy (USN) has developed the Navy Response Action Contract (RAC) program to conduct site assessments (SAs), evaluate potential corrective actions, and design the selected remedial actions at hazardous waste sites at USN facilities. Bechtel Environmental Incorporated (BEI) provides technical assistance in implementing the remedial action portion of the Navy RAC program.

1.2 SCOPE OF PROJECT

T his report details the SA activities conducted by BEI at the F-18 crash site, located in the Ocala National Forest approximately 120 miles south of the Naval Air Station (NAS) Cecil Field, Jacksonville, Florida. The site resulted from an F-18 aircraft crash occurring June 21, 1994. This expedited SA was initiated to determine potential groundwater contamination resulting from JP-5 jet fuel. USN personnel have determined that approximately 1,285 gallons of JP-5 jet fuel was on board at the time of impact. The site is within a wooded area of the Ocala National Forest. This SA was conducted to determine the lateral and vertical extent of potential petroleum hydrocarbon contamination in soil and groundwater at the crash site. It will also provide the data necessary to support the evaluation of corrective action alternatives and the selection, design and implementation of the preferred corrective action in accordance with applicable Florida Department of Environmental Protection (FDEP) requirements.

1.3 ENVIRONMENTAL SETTING

1.3.1 Meteorology

Information from the National Oceanic and Atmospheric Administration (NOAA) indicates that the climate at the Ocala National Forest consists of long humid summers and warm mild winters. The average mean annual temperature range is 59-83 degrees Fahrenheit. Mean annual precipitation is 54 in/yr. The approximate net precipitation (the difference between mean precipitation and mean evaporation) is 45 in/yr, (NOAA Local Climatological data 1985 and personnel communication USGS Orlando, Florida).

222-F0000116

1.3.2 Physiography and Surface Drainage

Lake County, Florida, which includes the area of the crash site, is located in the Southeast Coastal Plain area. It is characterized by a relatively flat, low-lying area in which altitudes range from sea level at the coast to about 320 feet down the center of the Florida peninsula. Much of the area is a nearly flat plain, less than 32 feet above sea level. The Southeast Coastal Plain is underlain by unconsolidated deposits consisting of sand, gravel, clay, and shell beds. In the vicinity of the site, the topography is characterized by gently rolling hills, which are approximately 80-90 feet above mean sea level (MSL), consisting of mainly sand with minor amounts of interbedded clayey sand lenses.

The site is located in the St. Johns River Water Management District. Surface drainage flows across the site to the west toward Grassy Prairie, a shallow grassy pond. Based on surface water elevations, noted on the 7.5 minute series topographic map, Lake Mary Quadrangle, Marion County, Florida, the apparent surficial aquifer flow direction is to the northeast. This observation is directly related to nearby surface water elevations at Long Pond and Fish Trap Pond which are located to the northeast of Grassy Prairie. Discussions with the USGS indicated that the surficial aquifer flow is approximately 0.01 to 0.5 feet per year.

Based on the potentiometric surface of the upper Floridian aquifer in the St. Johns River Management District where the crash site is located along the groundwater divide which flows to either the west towards Silver Spring, or to the east toward Alexander Spring. The elevation of the Floridian aquifer at the site is approximately 50 feet above the MSL, and approximately 35 feet below ground level (BGL) of the crash site with a porosity of approximately 20 percent and a vertical flow component of approximately 2 feet per year.

Bedrock at the site is approximately 80 to 90 feet BGL. It consists of limestone and is considered the primary reservoir rock of the Florida aquifer. The surficial aquifer is in direct communication with the Florida aquifer. The site is located in the recharge zone of the Floridian aquifer.

2.0 SUMMARY OF FIELD ACTIVITIES

A CME-450 hollow stem auger drill rig was selected for temporary piezometer well installation and soil sampling. Upon arrival to the site, and prior to any boring activities, the drill rig and equipment were thoroughly steam cleaned. After rig set up at each of the boring locations, the hollow stem auger was advanced to specified depths and samples were collected using a standard two-inch outside diameter (OD) stainless steel split spoon sampler. Soil borings were advanced to the vadose zone/saturated zone interface as specified in Appendix A. Soil samples were collected in duplicate and analyzed for headspace measurements with a organic vapor analyzer (OVA). Soil samples with the highest headspace reading, and the deepest unsaturated sample from each borehole were retained for laboratory confirmation analysis by ENCO laboratories, a state approved laboratory, and GEL laboratories, a Naval Energy and Environmental Support Activity

222-F000016

(NEESA) approved laboratory. The laboratory confirmation analysis allowed for the determination of the extent of potential petroleum hydrocarbon related contamination at the crash site. Boring logs for all completed boreholes are located in Appendix B. The boreholes, work zone ambient air, and workers breathing zone were continuously monitored during drilling operations with a combination combustible gas/oxygen meter and the OVA. Readings from the OVA are included at their respective sample intervals in Appendix C.

The SA assessed petroleum based hydrocarbons, Benzene, Toluene, Ethyl Benzene, and total Xylenes (BTEX) and, Total Recoverable Petroleum Hydrocarbons (TRPH), at the crash site. The OVA headspace survey and laboratory confirmation analyses were used for field interpretation of the extent of BTEX and TRPH in the soils and groundwater at the crash site.

The boring locations were selected to determine the vertical extent of potential hydrocarbons in the soil. After a selected borehole was advanced to the specified depth, a temporary piezometer well was installed. After completion of the piezometer well, a groundwater grab sample was collected for laboratory confirmatory analysis for BTEX and TRPH. The soil samples were analyzed for BTEX and TRPH according to EPA methods 8020 and 418.1, respectively. All borehole cuttings were retained for disposal pending results from the OVA headspace screening and laboratory confirmation activities.

The piezometer wells were constructed using 2-inch OD (nominal), flush joint, Polyvinyl Chloride (PVC) screen (0.010 inch slot) and riser, which were supplied pre-cleaned and packaged by the manufacturer. The screen and riser were installed in each well by connecting individual sections as they were lowered into the borehole through the auger column. After the riser assembly had been installed, the auger flights were removed in 5-foot sections.

The natural formation was allowed to collapse around the temporary piezometers. The piezometers each have 10-foot screens positioned approximately three feet above and seven feet below the static water level.

The piezometers were sampled using a bottom-filling Teflon bailer. These samples were hand delivered, while adhering to strict chain-of-custody procedures, to ENCO laboratories located in Jacksonville, Florida, an FDEP approved laboratory. Split samples were sent, via Federal Express, to GEL Laboratories, located in Charleston, South Carolina, a NEESA and FDEP approved laboratory. The groundwater samples were analyzed for BTEX and TRPH according to EPA methods 602 and 418.1, respectively.

222-F000016

3.0 SITE INVESTIGATION

3.1 Site Geology and Hydrology

The crash site is generally overlain by coastal sediments. A surficial layer of fine to coarse grained sand, approximately 12 feet in thickness, was observed at the crash site excavation. Below this sand layer, a very fine to medium coarse clayey silty sand was observed to be varying in thickness from approximately 0.2 to 4 feet thick. Below this clayey sand, a fine to coarse sand was encountered to the local aquifer. Minor amounts of gravel was observed throughout the sands encountered at the site.

The temporary piezometer well elevations were surveyed to determine relative elevations zeroed to a base station located on site (Table 1). Static groundwater elevations were recorded for all piezometers at the crash site (Table 2). Through comparison of the relative water levels of the piezometers, the local groundwater flow direction was determined to the northeast with a relative gradient ranging between 0.01 to 0.5 feet per year.

3.2 Subsurface Assessment

Soil and groundwater sampling was completed by BEI at the three piezometer locations. Analytical data for this investigation are presented in Appendix D. Data collected during the initial excavation activities, conducted September 12-23, 1994 (BEI), identified the aerial extent of petroleum hydrocarbons but did not accurately delineate the vertical extent.

The data obtained during the current investigation has successfully delineated the vertical extent of potential hydrocarbons within the excavation surrounding the original impact zone.

An OVA headspace survey was conducted on the soil samples collected during the soil boring and piezometer well installation program. Soil samples were collected at 2-foot intervals to the vadose zone/saturated zone interface. The OVA headspace survey results are included in Appendix C. The piezometers were installed in a triangular formation around the impact zone of the crash site based on site observations of the topography, dipping to the northwest, and surficial groundwater flow trending the northeast.

Results of the headspace field screening indicated that all values were less than 50 ppm in the soil. These observations were confirmed through laboratory analysis summarized on Table 3. All soil sample results were below the regulatory guidelines of 50 ppm TRPH and 100 ppb Volatile Organic Aromatic (VOAs). Likewise all groundwater sampling results were below the regulatory guidelines of 5 mg/l TRPH and 50 ug/l VOAs (Table 3).

4.0 CONCLUSIONS

As of the Crash Site Status Review Meeting, September 29,1994, Bechtel Environmental was tasked with costing a range of remedial alternatives that would prevent exposure to the maximum extent practical. The development of four remedial alternatives consisted of identifying applicable technologies and developing those technologies into alternatives. The range includes alternatives from the following categories:

- Landfarming
- Excavate additional 3000 tons and thermally treat
- Excavate additional 1500 tons and thermally treat
- No further action

Based on the results of headspace field screening and laboratory analysis of soil and groundwater samples, there is no indication of any residual contamination at the site. Bechtel proposes to backfill the excavation, from which there were 3460 tons of soil removed and treated, and restore the site.

DRAFT

APPENDIX A

Date: October 19,1994
To: Wayne Oehlman - ROICC (NASJAX)
From: V.H.Bauer - Bechtel Environmental,Inc.
Subject: Subsurface Assessment of F - 18 Crash Site

Dear Mr.Oehlman

Enclosed you will find an alternate approach for the F-18 subsurface assessment previously scoped on September 29,1994 at the crash site status review meeting. BEI has revisited the original directive from the September meeting and believes this approach is a more cost effective method of operation.

Additionally you will find minute meeting notes from the September 29,1994 status review meeting.

Attachment A details information made available in the September 29,1994 meeting.

Sincerely,

V.H.Bauer

V.H.Bauer

October 19, 1994
Subject: Subsurface Assessment of F-18 Crash Site
DO-0015, Task2, Phase 2, Remediation Work Plan for F-18 Crash Site
Jacksonville, Fl
Subject Code 5320

Dear Mr. Oehlman:

The following discussion describes Bechtel's basic understanding of the subsurface hydrogeological conditions at the F-18 Crash Site. These conditions were determined based on discussions with the United States Geological Survey (USGS), and a review of available information on the hydrogeological conditions of the local area. An approach to initially assess the site is also included.

Based on discussions between Bechtel and Mr. Charles Tibbals of the USGS, who resides in the local of the Crash Site, it has been determined that the Crash Site is at approximately 84 feet above mean sea level (MSL). Surface water in the vicinity of the Crash Site is between 60 to 65 feet above MSL, which indicates that a surficial aquifer might be approximately 20 to 25 feet below ground level (BGL). This is reflected by the elevation of Grassy Prairie, a shallow grassy pond, located approximately 1500 feet northwest of the Crash Site. Mr. Tibbals also informed Bechtel that he believed the flow direction of the surficial aquifer to be to the northwest at approximately 0.01 to 0.05 feet per day. The Crash Site is located on a mound which slopes to the northwest toward Grassy Prairie. Also, based on the 7.5 minute series topographic map of the local area at the Crash Site, the Lake Mary quadrangle, Marion County, Florida, surface water elevations indicate that the overall surficial groundwater flow directio might be to the northeast. This observation is directly related to near by surface water elevations at Long Pond and Fish Trap Pond which are located to the northeast of Grassy Prairie.

Further discussions with Mr. Tibbals also identified the Florida aquifer in the local area to be approximately 50 feet above MSL, approximately 35 feet BGL of the Crash Site. Furthermore, the potentiometric surface map of the upper Floridian Aquifer in the St. John's River Management District, where the site is located, indicates that the Crash Site is on a ground water divide. The potentiometric map of the Floridian Aquifer suggests that groundwater could flow to either the west towards Silver Spring, or the east toward Alexander Spring. This was also confirmed with Mr. Tibbals of the USGS. Mr. Tibbals added that the porosity of the Floridian aquifer in the local area is 20 percent with a vertical component of flow to be approximately 2 feet per year.

Bedrock at the Crash Site is approximately 80 to 90 feet BGL which consists of limestone and is considered the primary reservoir rock of the Florida Aquifer. The Surficial aquifer is in direct communication with the Florida aquifer. The Crash Site is located in the recharge zone of the Floridian aquifer, based on discussions with Mr. Tibbals and direct observations from the potentiometric surface map of the Florida aquifer.

Considering all of the above observations and basic assumptions of the subsurface conditions at the Crash Site, the activities for the subsurface assessments are as follows:

- Drill to groundwater three boreholes around the impact point of the Crash Site.
- Collect soil samples on 5-foot centers to depth for headspace screening with splits for laboratory confirmation analysis.
- Based on the results of headspace screening activities, select the split sample that had the highest headspace reading and deepest unsaturated soil sample for laboratory analysis.
- Upon completion of the boreholes, a temporary piezometer will be installed. The piezometers function is two fold, first, to collect a groundwater sample for laboratory analysis and secondly, to assist in the determination of groundwater elevation and possibly flow direction.
- The temporary piezometers will be installed by allowing the natural formation to collapse around the screen and casing upon withdraw of the hollow stem augers.
- Collect groundwater samples from the temporary piezometers for laboratory analysis. These wells will not be developed prior to sampling. These groundwater samples will be used for screening the presence or absence of potential constituents of concern only.
- Samples selected for laboratory analysis will be on a 24-hour turnaround basis.
- Upon receipt of the analytical results for the soil and groundwater samples collected, determine the presence or absence of constituents of concern in the soil and/or groundwater.
- Based on the analysis of the soil and groundwater samples, determine the need to install groundwater monitoring wells.
- The location of the groundwater monitoring wells will be determined in the field by the site geologist.
- If groundwater monitoring wells are required, soil samples will be collected for headspace screening. If headspace screening results are above the state regulatory action limit of 50 PPM TPH, the soil sample will be collected for laboratory confirmation analysis.
- Upon completion of the monitoring wells, the well will be formally developed prior to sampling.

- Groundwater samples will be collected from the groundwater monitoring wells for laboratory analysis.

- A survey will be completed of the groundwater monitoring wells including the temporary piezometers to identify the locations, both x and y coordinates, and the elevations of the ground surface and risers, z coordinates.

Upon completion of the above activities, Bechtel will be able to identify, in soil, the vertical limits of any constituents of concern at the impact point of the F-18 crash site the elevation, flow direction, and gradient of the surficial groundwater aquifer, and also the presence or absence of potential constituents of concern in the groundwater.

If you have any questions or concerns you may contact me at (904) 779-8900.

Sincerely,

V.H.Bauer

TO: Joe Capella

FROM: Fred Seale

DATE: 19 October 1994

SUBJECT: SUPPLIES REQUIRED FOR FIELD EFFORT AT F-18 CRASH SITE, MINIMUM REQUIREMENTS

1) The completion of 3 temporary two-inch piezometers to an estimated depth of 40-feet below ground surface.

All piezometer material will consist of schedule 40 PVC

Each piezometer will contain of the following:

33-feet of riser
10-feet of 10-slot screen

Therefore a total of:

99-feet of schedule 40 PVC riser
30-feet of 10-slot schedule 40 PVC screen

2) All borings will be completed with 4.25-inch inside diameter hollow stem augers.

3) Soil samples will be collected at 5-foot intervals with a standard 2-inch by 24-inch stainless steel split spoon. Estimated depth of soil sampling is 35-feet below ground level.

Therefore a total of:

7 split spoon samples per borehole
For a estimated total of 21 split spoon samples

4) State Certified Laboratory analysis of the soil and groundwater samples collected. Mandatory 24-hour turnaround for the requested analytical work by laboratory. Provide laboratory contact and phone number. Deliver analytical results, within 24-hours of receipt, by facsimile to Mr. Fred Seale, Comfort Inn, Mt. Dora, Fl. at (904) 383-8499 and also to the Bechtel Office located at NAS Cecil Field, Jacksonville, Fl. at (904) 779-8999 care of Mr. Fred Seale. A hard copy of the analytical report must also be sent to:

Bechtel Environmental, Inc.
Quarters E, G, Avenue
P.O. Box 171
NAS Cecil Field
Jacksonville, Florida 32215
Attn: Frederick Seale, Site Superintendent

Laboratory analysis required:

Soil:	BTEX	method 8020
	TRPH	method 418.1
Groundwater:	BTEX	method 602
	TRPH	method 418.1

MONITORING WELL INSTALLATION WILL BE REQUIRED BASED ON THE ANALYTICAL RESULTS OF THE ABOVE SOIL AND GROUNDWATER SAMPLES.

If installation of monitoring wells are to be completed the following supplies are required:

1) The installation of 3 two-inch monitoring wells to approximately 40-feet below ground level.

All monitoring well material will consist of schedule 40 PVC.
Each monitoring well will contain the following:

33-feet of riser
10-feet of 10-slot screen
1 locking expandable cap with lock
1 protective locking monument
1 concrete surface completion pad, with dimensions of 2x2 feet
1 Brass survey location pin

Therefore a total of:

99-feet of schedule 40 PVC riser
30-feet of 10-slot schedule 40 PVC screen
3 locking expandable caps with locks
3 protective locking monuments
3 concrete surface completion pads
3 brass survey location pins

2) All borings will be completed with a 4.25-inch inside diameter hollow stem auger.

3) Soil samples will be collected at 5-foot intervals with a standard 2-inch by 24-inch stainless steel split spoon. Estimated depth is 35-feet below ground level.

Therefore a total of:

7 split spoon samples per borehole
For an estimated total of 21 split spoon samples

4) Filter sand, bentonite, and grout for completion of the monitoring wells. It is estimated that the following volumes

are required to complete the proposed monitoring wells:

10/20 (or equivalent) filter sand, 350 pounds per well
1- 50 lbs bucket bentonite pellets per well
Approximately 50 gallons of grout, 5% bentonite, per well

Therefore a total of:

1050 pounds of 10/20 filter sand
3- 50 lbs buckets of bentonite pellets
Approximately 150 gallons of 5% bentonite grout

5) Survey locations of the three monitoring wells including the temporary piezometers for their X,Y, and Z coordinates tied into the state plane coordinate system.

6) Develop three monitoring wells until sediment free water is produced and the parameters of pH, temperature, and conductivity stabilize of three consecutive readings.

7) State Certified Laboratory analysis of the soil and groundwater samples collected. Mandatory 24-hour turnaround time of the requested analytical work by the laboratory. Provide laboratory contact and phone number. Deliver analytical results, within 24-hours of receipt, by facsimile to Mr. Fred Seale, Comfort Inn, Mt. Dora, Fl. at (904) 383-8499 and also to the Bechtel Office located at NAS Cecil field, Jacksonville, Fl. at (904) 770-8999 care of Mr. Fred Seale. A hard copy of the analytical report must also be sent to:

Bechtel Environmental, Inc.
Quarters E, G Avenue
P.O. Box 171
NAS Cecil Field
Jacksonville, Florida 32215
Attn: Frederick Seale, Site Superintendent

Laboratory Analysis required:

Soil:	BTEX	method 8020
	TRPH	method 418.1
Groundwater:	BTEX	method 602
	TRPH	method 418.1

8) Supply all required decontamination equipment and labor to decontaminate the drill rig, augers, downhole tools, sampling equipment, and all other associated equipment required to perform the required tasks described above.

9) Provide itemized cost estimate for the above referenced tasks.

TOOL BOX SAFETY AND HEALTH MEETING FORM

I certify that the attached safety meeting information was read and explained to the personnel in attendance indicated by their signatures below:

CRAFT: BEI, PSI, & SANTA FE PERSONNEL | FOREMAN | DATE: 10/25/94

WHERE MEETING HELD: C.F. - F-18 CRASH SITE | TIME MEETING HELD: 0715

NAMES AND CRAFT NUMBERS OF PERSONNEL ABSENT

TOPICS DISCUSSED: Todays activities - Finish PZ-003, send off samples to Lab. Modified Construction Attire w/ inner nitrile and outer nitrile PVC gloves w/ safety glasses and hearing protection.

SAFETY QUESTIONS AND/OR RECOMMENDATIONS DEVELOPED DURING MEETING: ① Lifting Practices, ② Proper PPE, ③ Heat Stress, ④ Equipment Decon

~~GENERAL FOREMAN'S SIGNATURE~~ SSHR Roger W. Olson, Jr. | DATE: 10/25/94

ACTION TAKEN ON ABOVE SUGGESTIONS OR QUESTIONS: ① Continue to wear lifting belts, ② Continue to wear proper PPE, ③ Drink at least 16 oz. fluid/hr. ④ Replace old visquen w/ new visquen and p

SUPERINTENDENT'S SIGNATURE: FREDERICK L. SEALE | DATE: 10/25/94

ACTION TAKEN ON ABOVE SUGGESTIONS OR QUESTIONS

ALL PERSONNEL ATTENDING THIS MEETING MUST SIGN THIS REPORT.

F-18 CRASH SITE

REMEDIAL ACTION ALTERNATIVES

September 29, 1994

Meeting Agenda

Introduction . . . . . Gerald Pearson

Job Description . . . . . Gerald Pearson

Status Report . . . . . Fred Seale

Alternatives . . . . . Hermann Bauer

(1) Continue original remedial action (Excavation/Incineration)

(2) Land farming on contaminated soil material.

(3) No further action

(4) Spread stockpiled material in adjacent cleared forest areas in thin layers

(5) In-situ soil vapor extraction

Discussion . . . . . All

Conclusion . . . . . Gerald Pearson

Action Items . . . . . Gerald Pearson

F-18 CRASH SITE

REMEDIAL ACTION ALTERNATIVES

Alternatives Description

Alternatives (1) Continue original remedial action (Excavation/Incineration)

- Excavation of soils with greater than approximately 65 ppm hydrocarbons
- Transportation of all excavated soil with greater than 65 ppm to the incinerator facility
- Incineration of soils with greater than 65 ppm

Alternative (2) Continue excavation and implement land farming for remaining stockpiled material.

- Excavate and stockpile soils with greater than 65 ppm
- Implement land farming using engineered cells with liner, drainage system runoff controls, cover, etc.

Alternative (3) No further action

- Cease all operations and restore disturbed area except crater.

Alternatives (4) Spread stockpiled material in adjacent cleared forest areas in thin layers

- Excavate and stockpile soils with greater than 65 ppm
- Spread soils with greater than 65 ppm over an adjacent area of the forest in thin layers

Alternative (5) In-situ soil vapor extraction

- Install soil vapor extraction wells

APPENDIX E

PETROLEUM CONTAMINATION
INITIAL REMEDIAL ACTION
REPORT FORM

An Initial Remedial Action report, detailing the initial remedial action (IRA), should be prepared to satisfy the requirements of Chapters 17-770.630(1)14; 17-773.500(1)(a)4; and 17-773.500(2)(a)4, Florida Administrative Code, (FAC). This form may be used for the IRA report. Additional pages may be necessary in order to properly document the IRA in detail. Failure to provide complete information may result in delays in technical reviews and in reimbursement of task. This report format (or a similar completed report detailing the IRA activities) should be sent to the appropriate contracted local program office **and** to:

Florida Department of Environmental Protection
Bureau of Waste Cleanup
~~Engineering Support Section~~
2600 Blair Stone Road
Tallahassee, FL 32399-2400
(904) 488-3935

I. **FACILITY NAME:** U.S. NAVY

Facility Address: Environmental Division, Code 18400 Cecil Field, 32215

DER Facility Number (if applicable): _____

Date IRA Initiated: 9-12-94 Date IRA Completed: 11-8-94

II. **FREI PRODUCT RECOVERY**

A. Type(s) of Product Discharged: JP-5 Jet Fuel

B. Quantity

1. Estimated Gallons Lost: 1,285
2. Gallons Recovered: 0 through 11-8-94 (date)
3. **Attach** Exhibit Indicating Amount of Product Recovered, Dates and Cumulative Totals.

C. **Attach** a Scaled Site Plan, Indicating the Locations and Product Thickness in Wells, Boreholes, Excavations, or Utility Conduits and Wells Utilized for Recovery of Free Product.

D. Method of Product Recovery: NA

E. Type of Discharge During Product Recovery: NA

F. Type of Treatment, i.e., Oil/Water Separator: NA

G. Attach Written Proof of Proper Disposal of Recovered Product: NA

III. SOIL EXCAVATION

NOTE: Soil shall be defined as excessively contaminated using the procedure stated in Chapter 17-770.200(2), FAC. Representative soil sampling shall be performed as close to the time of excavation as possible, but at no time shall exceed three (3) months prior to the start of excavation. Stockpiled soils greater than thirty (30) days on site waiting for treatment and disposal, must be re-sampled immediately prior to disposal to assure soils are still excessively contaminated. **NOTE:** See PCR-27 guideline for sites eligible for reimbursement.

If soil sampling data indicates that the amount of soil that is excessively contaminated exceeds 1500 cubic yards, treatment of all excessively contaminated soil at the site shall be addressed in a remedial action plan, and no soil IRA activities shall be performed except for the removal of soils in the immediate vicinity of the tanks.

Only soil above the ambient water table at the time of excavation can be considered as excessively contaminated soil.

Unless the established weight per unit volume of 1.4 tons/cubic yard (as referenced in FAC Rule 17-775) is used for the excavated soil, the weight per unit volume must be determined by a field test (in which an accurately measured volume of soil is weighed) at the time of excavation.

A. Actual Volume of Excessively Contaminated Soil Excavated in Cubic Yards: 2,692.6

Dimensions of Excavation Including Depth of Excavation(s): 145' X 65 X 12

1496.2cy clean soils segregated on-site.

NOTE: Attach written proof from the Department in the form of an Alternate Procedure Approval Order authorizing excavating over 1500 cubic yards if applicable. Authorization must be received prior to the excavation of soils.

B. Type(s) of Product in Soil: petroleum hydrocarbons

C. Depth (ft) to Groundwater at the Time of Excavation(s): approximately 35 ft.

D. Did Dewatering (i.e., groundwater depression) Occur at Time of Excavation?: NO

E. Type of Instrument and Method Used to Determine Excessive Soil Contamination: Organic vapor analyzer - reading of 50 ppm TRPH as defined in Ch. 17-770.200(2) of the FAC (EPA Draft Method 3540/9073)

F. **Attach** a table that compares the OVA-FID readings taken with charcoal filter verses readings without filter. Include vertical depths for each sample.

G. Using the OVA procedure for defining excessively contaminated soil as referenced in Rule 17-770.200(2), FAC, include a scaled site plan with the information listed below:

Appendix E-1

1. Location of excavation, old and new tank farm, dispensers, and product lines, and all soil samples. The corresponding OVA-FID readings for each soil sample (with charcoal filter and without) and its depth must be given.

2. **Soil Sampling Procedure** is as follows:

Start sampling in a location where it is suspected that excessively contaminated soil exists. Sample from the first soil boring outward in a grid pattern, at five (5) to ten (10) foot intervals, until the perimeter of the excessively contaminated soil plume is defined. Vertical sampling should be performed starting approximately at the initial area of contamination or surface and continued at three (3) foot intervals, or fraction thereof, until a depth approximately one (1) foot above the water table is reached.

H. Copies of Laboratory Analyses for Pre Treatment Soil Samples as Required in Chapter 17-775.410(3), Table II, FAC Must be **Attached.**

Appendix E-2

I. Were Tanks Replaced at this Site? If Yes, Indicate the Number, Size, and Location of New Tank Farm: NO

IV. SOIL TREATMENT AND DISPOSAL

A. Method of Treatment of Excessively Contaminated Soil: Incinerated - off site

B. For Off Site Treatment and Disposal at Permitted STTF, Land Farms, or Landfills Attach Documentation From the Treatment Facility Which Confirms the Weight or Volume of Soil Treated and Date Received. **NOTE:** See PCR-19 guideline for treatment at out-of-state facilities.

Appendix E-3

For Other Treatment and Disposal Methods (i.e. On-Site Land Farming, Bioremediation), **Attach** Post Treatment Laboratory Analyses for Each 250-300 Cubic Yards of Treated Soil in Accordance With Chapter 17-775.400 and the "Guidelines for Assessment and Remediation of Petroleum Contaminated Soils", Most Current Revision.

For Mobile Thermal Treatment Units, Attach Laboratory Analysis per Chapter 17-775(5), FAC.

C. Method of Disposal of Contaminated Soil and Indicate Recipient and Address: Contaminated soil will be loaded into trucks and transported off-site for thermal treatment.

V. ADDITIONAL COMMENTS: Requested information is attached in Appendix E-1, E-2, and E-3.

APPENDIX E-1

Date: October 19,1994
To: Wayne Oehlman - ROICC (NASJAX)
From: V.H.Bauer - Bechtel Environmental,Inc.
Subject: Subsurface Assessment of F - 18 Crash Site

Dear Mr.Oehlman

Enclosed you will find an alternate approach for the F-18 subsurface assessment previously scoped on September 29,1994 at the crash site status review meeting. BEI has revisited the original directive from the September meeting and believes this approach is a more cost effective method of operation.

Additionally you will find minute meeting notes from the September 29,1994 status review meeting.

Attachment A details information made available in the September 29,1994 meeting.

Sincerely,

V.H.Bauer

October 19, 1994
Subject: Subsurface Assessment of F-18 Crash Site
DO-0015, Task2, Phase 2, Remediation Work Plan for F-18 Crash Site
Jacksonville, Fl
Subject Code 5320

Dear Mr. Oehlman:

The following discussion describes Bechtel's basic understanding of the subsurface hydrogeological conditions at the F-18 Crash Site. These conditions were determined based on discussions with the United States Geological Survey (USGS), and a review of available information on the hydrogeological conditions of the local area. An approach to initially assess the site is also included.

Based on discussions between Bechtel and Mr. Charles Tibbals of the USGS, who resides in the local of the Crash Site, it has been determined that the Crash Site is at approximately 84 feet above mean sea level (MSL). Surface water in the vicinity of the Crash Site is between 60 to 65 feet above MSL, which indicates that a surficial aquifer might be approximately 20 to 25 feet below ground level (BGL). This is reflected by the elevation of Grassy Prairie, a shallow grassy pond, located approximately 1500 feet northwest of the Crash Site. Mr. Tibbals also informed Bechtel that he believed the flow direction of the surficial aquifer to be to the northwest at approximately 0.01 to 0.05 feet per day. The Crash Site is located on a mound which slopes to the northwest toward Grassy Prairie. Also, based on the 7.5 minute series topographic map of the local area at the Crash Site, the Lake Mary quadrangle, Marion County, Florida, surface water elevations indicate that the ove ..ll surficial groundwater flow direction might be to the northeast. This observation is directly related to near by surface water elevations at Long Pond and Fish Trap Pond which are located to the northeast of Grassy Prairie.

Further discussions with Mr. Tibbals also identified the Florida aquifer in the local area to be approximately 50 feet above MSL, approximately 35 feet BGL of the Crash Site. Furthermore, the potentiometric surface map of the upper Floridian Aquifer in the St. John's River Management District, where the site is located, indicates that the Crash Site is on a ground water divide. The potentiometric map of the Floridian Aquifer suggests that groundwater could flow to either the west towards Silver Spring, or the east toward Alexander Spring. This was also confirmed with Mr. Tibbals of the USGS. Mr. Tibbals added that the porosity of the Floridian aquifer in the local area is 20 percent with a vertical component of flow to be approximately 2 feet per year.

Bedrock at the Crash Site is approximately 80 to 90 feet BGL which consists of limestone and is considered the primary reservoir rock of the Florida Aquifer. The Surficial aquifer is in direct communication with the Florida aquifer. The Crash Site is located in the recharge zone of the Floridian aquifer, based on discussions with Mr. Tibbals and direct observations from the potentiometric surface map of the Florida aquifer.

Considering all of the above observations and basic assumptions of the subsurface conditions at the Crash Site, the activities for the subsurface assessments are as follows:

- Drill to groundwater three boreholes around the impact point of the Crash Site.
- Collect soil samples on 5-foot centers to depth for headspace screening with splits for laboratory confirmation analysis.
- Based on the results of headspace screening activities, select the split sample that had the highest headspace reading and deepest unsaturated soil sample for laboratory analysis.
- Upon completion of the boreholes, a temporary piezometer will be installed. The piezometers function is two fold, first, to collect a groundwater sample for laboratory analysis and secondly, to assist in the determination of groundwater elevation and possibly flow direction.
- The temporary piezometers will be installed by allowing the natural formation to collapse around the screen and casing upon withdraw of the hollow stem augers.
- Collect groundwater samples from the temporary piezometers for laboratory analysis. These wells will not be developed prior to sampling. These groundwater samples will be used for screening the presence or absence of potential constituents of concern only.
- Samples selected for laboratory analysis will be on a 24-hour turnaround basis.
- Upon receipt of the analytical results for the soil and groundwater samples collected, determine the presence or absence of constituents of concern in the soil and/or groundwater.
- Based on the analysis of the soil and groundwater samples, determine the need to install groundwater monitoring wells.
- The location of the groundwater monitoring wells will be determined in the field by the site geologist.
- If groundwater monitoring wells are required, soil samples will be collected for headspace screening. If headspace screening results are above the state regulatory action limit of 50 PPM TPH, the soil sample will be collected for laboratory confirmation analysis.
- Upon completion of the monitoring wells, the well will be formally developed prior to sampling.

- Groundwater samples will be collected from the groundwater monitoring wells for laboratory analysis.

- A survey will be completed of the groundwater monitoring wells including the temporary piezometers to identify the locations, both x and y coordinates, and the elevations of the ground surface and risers, z coordinates.

Upon completion of the above activities, Bechtel will be able to identify, in soil, the vertical limits of any constituents of concern at the impact point of the F-18 crash site the elevation, flow direction, and gradient of the surficial groundwater aquifer, and also the presence or absence of potential constituents of concern in the groundwater.

If you have any questions or concerns you may contact me at (904) 779-8900.

Sincerely,

V.H.Bauer

V.H.Bauer

TO: Joe Capella

FROM: Fred Seale

DATE: 19 October 1994

SUBJECT: SUPPLIES REQUIRED FOR FIELD EFFORT AT F-18 CRASH SITE, MINIMUM REQUIREMENTS

1) The completion of 3 temporary two-inch piezometers to an estimated depth of 40-feet below ground surface.

All piezometer material will consist of schedule 40 PVC

Each piezometer will contain of the following:

33-feet of riser
10-feet of 10-slot screen

Therefore a total of:

99-feet of schedule 40 PVC riser
30-feet of 10-slot schedule 40 PVC screen

2) All borings will be completed with 4.25-inch inside diameter hollow stem augers.

3) Soil samples will be collected at 5-foot intervals with a standard 2-inch by 24-inch stainless steel split spoon. Estimated depth of soil sampling is 35-feet below ground level.

Therefore a total of:

7 split spoon samples per borehole
For a estimated total of 21 split spoon samples

4) State Certified Laboratory analysis of the soil and groundwater samples collected. Mandatory 24-hour turnaround for the requested analytical work by laboratory. Provide laboratory contact and phone number. Deliver analytical results, within 24-hours of receipt, by facsimile to Mr. Fred Seale, Comfort Inn, Mt. Dora, Fl. at (904) 383-8499 and also to the Bechtel Office located at NAS Cecil Field, Jacksonville, Fl. at (904) 779-8999 care of Mr. Fred Seale. A hard copy of the analytical report must also be sent to:

Bechtel Environmental, Inc.
Quarters E, G, Avenue
P.O. Box 171
NAS Cecil Field
Jacksonville, Florida 32215
Attn: Frederick Seale, Site Superintendent

Laboratory analysis required:

Soil:	BTEX	method 8020
	TRPH	method 418.1
Groundwater:	BTEX	method 602
	TRPH	method 418.1

MONITORING WELL INSTALLATION WILL BE REQUIRED BASED ON THE ANALYTICAL RESULTS OF THE ABOVE SOIL AND GROUNDWATER SAMPLES.

If installation of monitoring wells are to be completed the following supplies are required:

1) The installation of 3 two-inch monitoring wells to approximately 40-feet below ground level.

   All monitoring well material will consist of schedule 40 PVC.
   Each monitoring well will contain the following:

   33-feet of riser
   10-feet of 10-slot screen
   1 locking expandable cap with lock
   1 protective locking monument
   1 concrete surface completion pad, with dimensions of 2x2 feet
   1 Brass survey location pin

   Therefore a total of:

   99-feet of schedule 40 PVC riser
   30-feet of 10-slot schedule 40 PVC screen
   3 locking expandable caps with locks
   3 protective locking monuments
   3 concrete surface completion pads
   3 brass survey location pins

2) All borings will be completed with a 4.25-inch inside diameter hollow stem auger.

3) Soil samples will be collected at 5-foot intervals with a standard 2-inch by 24-inch stainless steel split spoon. Estimated depth is 35-feet below ground level.

   Therefore a total of:

   7 split spoon samples per borehole
   For an estimated total of 21 split spoon samples

4) Filter sand, bentonite, and grout for completion of the monitoring wells. It is estimated that the following volumes

are required to complete the proposed monitoring wells:

10/20 (or equivalent) filter sand, 350 pounds per well
1- 50 lbs bucket bentonite pellets per well
Approximately 50 gallons of grout, 5% bentonite, per well

Therefore a total of:

1050 pounds of 10/20 filter sand
3- 50 lbs buckets of bentonite pellets
Approximately 150 gallons of 5% bentonite grout

5) Survey locations of the three monitoring wells including the temporary piezometers for their X,Y, and Z coordinates tied into the state plane coordinate system.

6) Develop three monitoring wells until sediment free water is produced and the parameters of pH, temperature, and conductivity stabilize of three consecutive readings.

7) State Certified Laboratory analysis of the soil and groundwater samples collected. Mandatory 24-hour turnaround time of the requested analytical work by the laboratory. Provide laboratory contact and phone number. Deliver analytical results, within 24-hours of receipt, by facsimile to Mr. Fred Seale, Comfort Inn, Mt. Dora, Fl. at (904) 383-8499 and also to the Bechtel Office located at NAS Cecil field, Jacksonville, Fl. at (904) 770-8999 care of Mr. Fred Seale. A hard copy of the analytical report must also be sent to:

Bechtel Environmental, Inc.
Quarters E, G Avenue
P.O. Box 171
NAS Cecil Field
Jacksonville, Florida 32215
Attn: Frederick Seale, Site Superintendent

Laboratory Analysis required:

Soil:	BTEX	method 8020
	TRPH	method 418.1
Groundwater:	BTEX	method 602
	TRPH	method 418.1

8) Supply all required decontamination equipment and labor to decontaminate the drill rig, augers, downhole tools, sampling equipment, and all other associated equipment required to perform the required tasks described above.

9) Provide itemized cost estimate for the above referenced tasks.

September 29,1994 Crash Site Status Review Meeting

September 29, 1994
Subject: F-18 Crash Site Status Review
DO-0015, Task 2, Phase 2, Remediation Work Plan for F-18 Crash Site
Jacksonville, Fl
Subject Code 1100

Attendees:

Steve Wilson
Diane Webster
Gerald Pearson
Herb Frazier-Rahiem
Scott Dombrosky
Wayne Oehlman
Urusla Klimas
V.H.Bauer
Fred Seale

Subject: Review Current Status

Gerald Pearson opens the meeting by stating that the site resulted from an F-18 aircraft crash on June 21,1994 @ 10:50 PM. The anticipated remedial action is necessary to preclude possible groundwater contamination resulting from the JP-5 fuel. Navy Personnel have determined that approximately 1,285 gallons of JP-5 fuel were on board at the time of impact.

Steve Wilson reviews meeting agenda that covers:

Operational process & potential problems
Alternative issues for closures
Sampling methods & ground water contamination
Lessons learned

Fred Seale reviews the project status - items discussed

Mobilization
Clearing
Soil Excavation
Monitoring Well Installation
Waste Transportation

Project Field Operations started September 12,1994 - All Construction equipment, tools, materials and a established work force were functional by September 12,1994. After field screening exercises determined a level of personnel protection, excavation operations were iniated by mid morning September 12,1994. Field operations continued adhering to the

original work plan of removing contaminated soils having an organic vapor analyzer (OVA) reading's of 50 parts per million (ppm) for kerosene group contaminants. BEI's directive - soil would be excavated up to 20' below the crater surface or until two successive vertical 2' samples are less than 50 ppm TRPH(OVA reading). Excavation operations continued September 12, 1994 through September 23, 1994, accumulating 3140 tons of contaminated soil designated for offsite incineration. On September 14, 1994 BEI recognized that excavated quantities were going to exceed the original estimated quantity of 700 tons / 500 cy.

BEI recommended a field that a field boring exercise would assist in characterizing the site and would also assist in evaluating the remaining quantities of contaminated soil. Field boring operations were initiated on site September 19, 1994 and were completed on September 22, 1994. For results of the boring activities see (attachment A).After evaluating the various headspace readings accumulated from the field boring exercise, BEI's forecasted quantities of contaminated soil to be removed would increaseby 3000 tons. (total estimated tonnage would increase in access of 6000 tons).

On September 23,1994 Wayne Oehlman contacted BEI and decided that the project would need to be placed on hold until project costing issues were resolved. Therefore all operations were suspended immediately as of September 23, 1994.

Ursula Klimas questions soil sampling techniques in the field.
A general review of BEI's soil sampling technique & frequency of calibration for field screening instruments (OVA) was discussed in detail..
Conclusion: BEI's field sampling & instrument calibration frequency was determined to be accurate & responsive to project requirements.

General question was asked why BEI backfilled the crater pit after having excavated its lower elevation to a total depth of 51'. Answer: Backfill operations of the immediate crater pit were performed to insure personnel safety and to prepare a working platform for the incoming drilling rig.

Herb Frazier, Diane Webster, Steve Wilson, Wayne Oehlman and Herman Bauer discuss various elements of providing accurate internal lines of communication to all team members.

Conclusion's of team meeting:
Due to the unknown quantities of contaminated soil subject for removal a lower subgrade elevation and the concerns over contamination having perched the regional aquifer, BEI was given a directive to install two monitoring wells to determine groundwater flow direction and to analyze groundwater for contamination. Additionally split spoon sampling will be evaluated & analyzed utilizing BTEX & TPH methods. A site characterization report will be prepared after the analytical summary has been received by BEI. BEI will perform a geotechnical analysis on soil samples in accordance with ASTM D2488. This

information will yield a soil description & range of permeability values. The final BEI effort will be to evaluate the cost issues for site closing alternatives.

The alternatives are listed below

a. landfarming
b. excavation of 1500 tons
c. excavation of 3000 tons
d. to spread remaining contamination over nearby area
e. backfill area with no further action
f. cost to characterize site
