SECTION I

SECTION I
REPORT SUMMARY

A. Scope. The U.S. Army Corps of Engineers, Fort Worth District (COE), was tasked by the Air Force in December 1992 to perform a Remedial Investigation (RI) under the Air Force Installation Restoration Program (IRP) for the Base Service Station (BSS), Building (Bldg) 1518, at Carswell Air Force Base (CAFB), Texas. The COE scope of work required soil borings, a soil gas survey, monitor well installations, and groundwater sampling to define the nature and extent of the petroleum hydrocarbon contamination originating from the site. Surface water sampling was later added to the scope.

B. Results. This Comprehensive Site Assessment (CSA) report summarizes the 1-year effort of investigations by the COE to characterize the nature and extent of an unknown quantity of gasoline released at various times and rates over a period of possibly 10 years or more from the BSS underground storage tank (UST) system. Results indicate the gasoline release has impacted soil along the extent of the UST system, has impacted the uppermost saturated zone extending approximately 500 feet from the BSS east and downgradient to the West Fork of the Trinity River, and has impacted surface water within drainage ditches adjacent to the BSS. Groundwater contaminated with petroleum hydrocarbons from the release is discharging to the water of the West Fork of the Trinity River along an approximate 65-foot length of its western bank. The river is also threatened by the contaminated surface water drainage from the BSS where drainage paths outfall to the river.

Maximum concentrations of TPH and BTEX found in the soil along the UST system were 630 ppm and 1119 ppm, respectively. This soil

continues to act as a source of contaminants to the groundwater which occurs at depths varying between 5 to 7 feet along the extent of the UST system. The maximum concentrations of dissolved phase TPH and BTEX occur immediately north of and adjacent to the tank excavation, where TPH was found at a concentration of 20 mg/l and BTEX was found at a concentration of 45.88 mg/l, and along a line leading from the former tank location to the seepage area, where TPH was found at 9.8 mg/l and BTEX was found at 46.07 mg/l where groundwater flows downgradient across the installation boundary to the river.

Concentrations of TPH and BTEX in soil within the seepage area along the river's western bank are as high as 130 ppm and 1,147 ppm, respectively. The impact on the surface water of the river has not been quantified. Surface water within the drainage ditch adjacent to the BSS contained BTEX at a concentration of 2.257 mg/l, with no TPH detected. Soil within the same drainage ditch contained TPH at a concentration of 210 ppm, with no BTEX detected.

Recommendations are to treat or remove the contaminated soil along the extent of the UST system to reduce any further release of petroleum hydrocarbons to the groundwater, to mitigate off-site migration of groundwater contaminants by installing a treatment system within the installation boundary, and to perform a risk assessment to determine the impact to health and the environment of contaminated surface water along the drainage ditches and along the course of the West Fork of the Trinity River, as well as contaminated groundwater to deeper drinking water aquifers. Results of the risk assessment should be used to determine the degree to which remediation should be performed.

C. Regulatory Authority. The BSS has been an IRP site, designated

ST16, since 1988 when it was first investigated under the IRP for known gasoline releases from the station's UST system. The BSS is regulated by the Texas Natural Resource Conservation Commission (TNRCC) under 31 TAC Chapter 334, Underground and Aboveground Storage Tanks. The TNRCC Owner I.D. No. for the BSS site is 04532. The TNRCC Facility I.D. No. is 0009696. The TNRCC Leaking Petroleum Storage Tank (LPST) I.D. No. for the BSS site is 104524.

D. Report Format. Several investigations of the site were performed by various contractors to the Air Force from 1988 until December 1992 when the COE began the work addressed in this report. Previous investigations performed by contractors other than the COE or by contracts other than those administered by the COE are briefly summarized in Section II, Chronology of Events. Details from these investigations are discussed in this report where they impacted defining the scope of the work performed or contributed to the conclusions and recommendations.

The remainder of the report is structured as a Comprehensive Site Assessment (CSA) Report following the format required by the TNRCC addressing UST releases. A formal Limited Site Assessment (LSA) has never been performed for the BSS; however, other investigations have addressed many of the LSA requirements. The report entitled Sampling Results, May 1993 (COE, 1993), prepared by the COE in July 1993 and submitted to TNRCC by the Air Force Base Conversion Agency (AFBCA) at a later date, contains a first attempt at consolidating the previous work done at the site. Reference to this document is made often throughout this CSA report.

TAB

SECTION II

**SECTION II
CHRONOLOGY OF EVENTS**

- 1972 Base Service Station constructed with four 10,000-gallon fiberglass underground storage tanks and one 600-gallon waste oil tank.
- Dec 1983 Leaking flex line in fuel distribution system replaced. Two other leaking flex lines replaced previous to Dec 1983.
- Nov 1984 Gasoline discovered in drainage ditch under BSS driveway. Super unleaded gasoline loss of 1900 gallons over 3 weeks in BX record books. Leaking rubber transfer line to one pump discovered and repaired.
- Dec 1984 Gasoline discovered again in drainage ditch. Regular and unleaded fuel lines tested and found to be leaking. Approximately 10 to 15 gallons of gasoline per day removed from drainage ditch.
- Pre-1988 Base Service Station added to the Installation Restoration Program.
- Feb 1988 Soil boring BSS-D drilled and monitor wells BSS-A, BSS-B, and BSS-C installed by Atec Associates under contract to Radian Corporation under Stage 2 IRP.
- Apr 1992 Petroleum seep noted occurring along west bank of West Fork of the Trinity River approximately 500 feet downgradient of the BSS and reported to Texas Water Commission (TWC). Notice of Violation (NOV) issued by TWC for release to river.
- Aug 1992 Monitor wells MW-1 and MW-2 installed by Maxim Engineers to determine existence of subsurface contamination downgradient of BSS and upgradient of West Fork of the Trinity River seep. Soil contaminated with TPH from water table to total depth of 50 feet in MW-1, and from water table to depth of 20 feet in MW-2. Water samples showed 15.2 ppm TPH and 29.570 ppm BTEX in MW-1 and 4.0 ppm TPH and 6.745 ppm BTEX in MW-2.
- Magna-Scan investigation performed using electromagnetic offset logging (EOL) technique to measure resistivity changes in geology and fluid content. Identified area of high resistivity indicative of hydrocarbon contamination along top of water table extending east of MW-1 and west of MW-2 in a northeast-southwest direction.
- 900-gallon variance noted at BSS.
- Sep 1992 UST Services, Inc., leak tested tanks. Suspect tank could not be filled and was emptied. Two other tanks failed at rate of .75 gallons per hour. One tank was tight. TWC was notified and visited the site. TWC requested immediate

action on free product (2 inches) in well BSS-B and issued 9-point corrective action letter.

Gasoline sales terminated at BSS.

Monitor well MW-3 installed by Maxim Engineers to determine possible upgradient source for MW-1 and MW-2 contamination and to assess adjacent upgradient aboveground storage tank farm. Soil contained 51.2 ppm at 3 feet and 10.6 ppm at 17.5 feet. Water sample detected no BTEX or TPH.

- Oct 1992 Monitor wells MW-4, MW-5, and MW-6 installed by Leak-Tec.
- Abandoned Chevron pipeline excavated and inspected by Tarrant County Water Board in three areas along 100 feet of pipeline immediately upslope and upgradient of seepage area. No evidence of release was noted.
- Dec 1992 COE tasked with performing Remedial Investigation (RI).
- COE drilled and sampled soil borings ST16-1, ST16-2, and ST16-3 along fuel distribution lines.
- Jan 1993 CAFB requested COE to pull BSS tanks.
- Feb 1993 Soil gas survey was performed by Target Environmental Services, Inc., under contract to COE.
- Apr 1993 Wells SAV-1 and SAV-2 were installed by Professional Service Industries, Inc., under contract to Air Force, for purpose of installing recovery system. Completion of recovery system halted at request of TWC.
- May 1993 COE surveyed the site and sampled wells SAV-1, SAV-2, BSS-A, BSS-B, and MW-1 through MW-6. COE collected shallow soil sample SED-1 and surface water sample SW-1 at seep area on west bank of the West Fork of the Trinity River. COE also collected surface water samples SW-2 through SW-5 along surface drainage paths leading from the BSS.
- Perry Williams, Inc., removed four 10,000-gallon underground storage tanks (USTs) under contract to COE. Fuel lines capped and contaminated soil were returned to the excavation.
- Aug 1993 COE Sampling Results report documenting May 1993 sampling event submitted to AFBCA.
- Sep 1993 COE collected shallow soil sample SED-1A at seep area on west bank of West Fork of the Trinity River.
- Oct 1993 COE collected shallow soil samples and surface water samples along surface drainage paths at SW/SED-2A, SW-3A, SW/SED-4A, and SW/SED-5A.
- Dec 1993 COE completed installing monitor wells MW-7 through MW-12,

plugging monitor well BSS-C, and redeveloping and completing wells SAV-1 and SAV-2. New well locations and elevations surveyed.

- Jan 1994 COE sampled monitor wells SAV-1, SAV-2, BSS-A, BSS-B, and MW-1 through MW-12.
- Jun 1994 COE submitted Comprehensive Site Assessment (CSA) Report to Air Force Base Conversion Agency.

TAB

SECTION III

SECTION III
TEXT

A. Soil Assessment. The procedures used by the COE to determine the horizontal and vertical extent of soil contamination consisted of performing a soil gas survey, drilling and sampling three soil borings, ST16-1, ST16-2, and ST16-3 along the fuel distribution lines leading to the fuel dispenser islands, and soil sampling performed within the tank excavation during the tank removal. Soil samples were also collected during the installation of monitor wells MW-7 through MW-12. A map of the site showing all sample locations is shown on Figure 1. Subsurface profiles for the site are shown on Figures 2 through 5.

1. Soil Borings. The COE drilled three soil borings, ST16-1, ST16-2, and ST16-3, in December 1992 along the fuel lines leading to the fuel dispensers for the purpose of determining if fuel had been released from these lines. A sketch showing the layout of the tank and piping system is shown on Figure 6. The boring locations are shown on Figure 1 and the boring logs are contained in Appendix A. Survey data for the soil borings are shown on Table 1.

a. Drilling and Sampling Plan. All borings were drilled using a Nitco drill rig. Borings were advanced through the asphalt using an 8-inch auger. Each boring was then advanced into groundwater using an 8-inch diameter continuous flight hollow stem auger. Soil samples were collected at 2-foot intervals using a 6-inch diameter split barrel sampler. A grab sample of the groundwater from each boring was collected 24 hours after drilling was complete for the purpose of determining if any release from the lines had impacted groundwater. Each boring was purged of three volumes of water prior

to obtaining the water sample. All drill cuttings and purge water were contained in 55-gallon steel drums.

b. Soil Sample Analytical Results. Soil samples from these soil borings were analyzed for total petroleum hydrocarbons (TPH) using EPA Method 418.1, for TCLP lead (Pb) using EPA Methods 1311 and 6010, and for TCLP benzene, TCLP toluene, TCLP ethylbenzene, and TCLP xylenes using the EPA Methods 1311 and 8020. Analytical results for the soil samples are compiled on Table 2. Included on Table 2 are the date each sample was taken, the soil boring number where the sample was collected, the field sample number and corresponding laboratory I.D. number for each sample, the depth of the interval sampled, the analytical method used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix A.

c. Soil Contamination Map. The vertical distribution of petroleum hydrocarbon contamination in each soil boring as determined from the laboratory analyses is shown on the chemical boring logs contained in Appendix A. The extent of soil contamination is illustrated on the subsurface profile shown on Figure 4. Results are discussed in Section IV.

d. Groundwater Sample Analytical Results. Grab samples of the groundwater collected from each of the soil borings were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020, for Pb using EPA Method 6010, for TPH using EPA Method 418.1, and for total dissolved solids (TDS) using EPA Method 160.1. Analytical results for the groundwater grab samples are compiled on Table 3. Included on Table 3 are the date each sample was taken, the soil boring where the sample was collected, the laboratory I.D. number

for each sample, the analytical method used, and the results obtained. The soil boring number is the same as the field sample number for each sample. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix A. Results are discussed in Section IV.

2. Soil Gas Survey. A soil gas survey was performed from 24-26 February and on 1 March 1993 by Target Environmental Services, Inc. (TARGET) under contract to COE. The purpose of the survey was to help determine the areal extent of contaminated groundwater emanating from the BSS. A copy of the soil report containing all of the survey data is contained in Appendix A.

A total of 86 soil gas samples were collected at depths varying from 4 to 9 feet across the survey area. Groundwater had been measured at a depth of 10.5 feet in monitor wells prior to performing the survey. Samples were analyzed for total flame ionization detection (FID) compounds using EPA Method 602 Modified and the standards for benzene, toluene, ethyl benzene, and xylenes. Sample locations were along a 50-foot grid spacing.

Results of the soil gas survey indicated significant levels of petroleum hydrocarbons present along the sewer line east of Rogner Drive and along the western side of Rogner Drive. The chromatogram signature of the samples collected on the western side of Rogner Drive were characteristic of relatively unweathered gasoline, with xylene map patterns consistent with the BSS as the source. The chromatographic data for samples collected along the sewer line suggested vapor phase migration of the volatile hydrocarbons was occurring along this route. Low levels of gasoline hydrocarbons were detected along the eastern boundary of the survey area, which

suggested groundwater contamination extended this far across the survey area; however, no volatile hydrocarbons were detected in samples collected from the central portion of the survey area, which would have connected the release from the BSS to the eastern boundary investigated. It was suspected vertical vapor migration was impeded in this area by clay and silt soils.

3. **UST Removal.** The COE contracted with Perry Williams, Inc. (PWI) from Amarillo, TX, to remove the four 10,000-gallon fiberglass gasoline tanks. Complete documentation of the UST removal is contained in the PWI document entitled Petroleum Storage Tank Removal & Initial Site Assessment for BX Service Station - Site 1518 and Aircraft Generation Equipment Shop - Site 1628, prepared for the COE and submitted to TNRCC by the Air Force on 14 October 1993.

a. **UST Removal and Sampling Plan.** Notice to proceed was given on 30 April 1993. The tanks were exhumed on 11 and 12 May 1993. The two middle tanks, designated as tanks B and C by PWI on Figure 7 and shown on the 1972 as-builts as containing regular gasoline (Tank B) and premium gasoline (Tank C), were noted as being damaged. Tank B had a patch screwed into the bottom of the tank and Tank C had a long slender gash at its southern end. The other two tanks appeared to be in good condition. Once exhumed, approximately 100 gallons total of remaining fluids were removed from the tanks by Mobley Company. A total of 75 feet of associated piping were removed from the tank excavation. All piping was noted by PWI to be in good condition. Remaining fuel lines leading to the fuel dispensers were capped in-place. Samples collected by PWI on 12 May 1993 for chemical analysis consisted of 13 soil samples from the sidewalls of the excavation, three soil samples from the stockpile of excavated soil, and one

groundwater sample from within the excavation. Soil sample locations, as documented by PWI, are shown on Figure 7.

b. Soil Sample Analytical Results. Soil samples collected from the sidewalls of the tank excavation and from the stockpile of excavated soil were analyzed for TPH, BTEX, and total Pb using EPA Methods 418.1, 8020, and 7420, respectively. Analytical results for each sample are shown on Figure 7. Signed laboratory reports, chain of custody forms, and complete documentation for the sampling performed are contained in the July 1993 PWI report submitted to TNRCC in October 1993.

c. Soil Contamination Map. The distribution of petroleum contamination within the tank excavation is shown on Figure 7. The extent of soil contamination is illustrated on the subsurface profile shown on Figure 4.

d. Groundwater Analytical Results. Groundwater was encountered during excavation at a depth of approximately 6 feet. Water within the excavation was notably contaminated with gasoline, exhibiting a very strong fuel odor and becoming very foamy when disturbed. One groundwater sample was collected and analyzed for TPH, BTEX, Pb, total organic halides (TOX), TDS and pH using EPA Methods 418.1, 8020, 7420, 9020, 160.1, and 9040, respectively. Analyses showed the sample to contain 14 mg/l TPH, 25.37 mg/l BTEX, 1.3 mg/l TOX, and 780 mg/l TDS. Lead was not detected above the detection limit of 0.1 mg/l, and the pH was 6.7.

4. Monitor Well Borings. The COE drilled six well borings from 23 November to 9 December 1993 for the purpose of installing groundwater monitor wells MW-7 through MW-12 to define the edge of the groundwater contaminant plume. Well boring locations are shown on

Figure 1. Soil and chemical boring logs are contained in Appendix A. Survey data are shown on Table 1.

a. Drilling and Sampling Plan. All well borings were drilled using 8-inch and 10-inch diameter augers to advance and clean out the borings and 3-inch diameter Shelby tube samplers to obtain continuous samples. All samples were continuously screened using a photoionization detector (PID) in an effort to determine the presence and vertical extent of contamination. Borings were advanced to a final depth not to exceed 8 feet below where groundwater was encountered in MW-7 and not to exceed 18 feet below where groundwater was encountered in the remaining borings for placement of 10- and 20-foot well screens across the top of the water table to account for seasonal fluctuations. Well boring MW-7 was advanced into limestone using a 7-7/8-inch diameter rockbit with no further soil sampling performed. All soil cuttings were placed in 55-gallon drums.

Three soil samples for chemical analysis were taken from each boring. The first sample, FS-1, was taken from the zone of highest contamination above the water table as indicated by the PID. If no contamination was indicated by the field screening, a soil sample for chemical analysis was taken from a representative material of the unsaturated zone. The second soil sample, FS-2, was taken from immediately above the water table. The third sample, FS-3, was taken from the bottom of the boring within the saturated zone. The distribution of these sampling intervals conforms to TNRCC guidance for performing limited site assessments (LSAs) for leaking petroleum storage tanks (LPSTs).

As required by TNRCC LSA guidance, an undisturbed soil sample was taken from each well boring MW-8 and from well boring MW-10 for

determining the soil parameters bulk density, effective porosity, fraction organic carbon, and volumetric water content. Each sample was obtained using a Shelby tube. A 1-foot long sample was taken from 7 to 8 feet in MW-8. This sample was extruded in the field, was wrapped in foil, then was sealed in wax prior to shipping to the COE Southwestern Division Laboratory (SWD Lab) in Dallas, Texas, for analysis. The sample from well boring MW-10 was also obtained using Shelby tube; however, it was not extruded in the field but was sealed in the tube for shipment to SWD Lab.

b. Soil Sample Analytical Results. Analytical results for the soil samples collected from each of the well borings are compiled on Table 4. Included on this table are the date each sample was taken, the boring number where the sample was collected, the field sample number (FS) and corresponding laboratory I.D. number for each sample, the depth of the interval sampled, the analytical method used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix A.

c. Soil Contamination Map. The vertical distribution of petroleum contamination in each soil boring as determined from field screening and from laboratory analyses is shown on the chemical boring logs contained in Appendix A. Results are discussed in Section IV.

d. Physical Soil Parameters. The two Shelby samples obtained from well borings MW-8 and MW-10 were analyzed by SWD Lab for the following parameters: Water Content using ASTM D 2216; Fraction Organic Carbon using ASTM D 2974; Density using ASTM D 2937; and Specific Gravity of Solids using ASTM D 854. Porosity was calculated using the specific gravity value obtained from that analysis. Results

for these analyses are shown on Table 5. A copy of the laboratory report is contained in Appendix A.

B. Groundwater Assessment. The COE installed six monitor wells, MW-7 through MW-12, from 23 November through 9 December and performed a complete round of groundwater sampling for all 16 wells monitoring the site from 3 through 6 January 1994. Existing well BSS-C was plugged, and existing wells SAV-1 and SAV-2 were developed and completed at ground level. A copy of the State of Texas Plugging Report (form TWC-0055) for BSS-C is contained in Appendix B. New survey data for wells SAV-1 and SAV-2 are contained on Table 1. All well locations are shown on Figure 1. A copy of the surveyor's report and surveyed elevation measurements for the site is contained in Appendix B.

1. Plume Delineation Procedures.

a. Monitor Well Locations. Prior to May 1993, a total of eleven groundwater monitoring wells had been installed by various contractors to the Air Force for the purpose of assessing groundwater contamination at the site. Different wells were sampled for various constituents at different times, but all of the wells had never been sampled at one time. The COE performed a complete round of groundwater sampling from 5-14 May 1993 in an attempt to assess the nature and extent of the contaminant plume. Results of this sampling event were compiled and discussed in the COE, 1993 document submitted by the Air Force to TNRCC.

The groundwater information obtained by the COE indicated the horizontal extent of the groundwater contaminant plume had not been defined. The COE proposed five additional monitor wells, MW-7 through MW-11, be installed at the locations shown on Figure 1 and another complete round of groundwater sampling be performed. The proposed

well locations were expected to be along the lateral limits of contamination, with wells MW-9 through MW-11 located to characterize and delineate the contamination leaving the installation and migrating towards the West Fork of the Trinity River. However, during the installation of MW-9, field screening of MW-9 indicated contamination present in the saturated zone, so MW-12 was added to the investigation plan to define the extent of the plume in the northerly direction. The locations of all existing and newly installed wells are shown on Figure 1. Survey data for well locations, ground elevations, and well casing elevations are compiled on Table 1.

b. Monitor Well Installation Procedures. Monitor wells MW-7 through MW-12 were installed by the COE from 23 November to 9 December 1993 using the drilling method described in Section III.A.4.a. Well boring diameters were 10 inches. Well boring depths were determined using subsurface data contained in COE, 1993, and using the water level elevations recorded on Table 6. The increasing thickness of saturated alluvium in the eastern downgradient direction across the site and the recorded fluctuation of groundwater elevations of as much as 7 feet in some of the wells dictated using 20-foot well screens for wells MW-8 through MW-12. Installing 20-foot well screens across the top of the water table required drilling these well borings to depths not to exceed 18 feet below where groundwater was encountered during drilling. The shallow depth to limestone and the resulting thin saturated zone in the area of MW-7 required installing only a 10-foot well screen in this well boring, with a maximum drilling depth not to exceed 8 feet below where groundwater was encountered.

Monitor wells were constructed using new 4-inch diameter PVC pipe

with flush-threaded joints. Well screens were preslotted 0.010 slot size. The well screen installed in MW-7 was 10 feet long. The well screens installed in the remaining five new wells were each 20 feet long. Each well screen was fitted with a plug in the bottom.

Each well screen was set at the bottom of the boring through temporary casing placed after drilling to keep the boring open. Silica sand was placed from the bottom of the boring to 2 feet above the top of the well screen. The sand was placed by hand as the temporary casing was pulled. Two feet of bentonite chips were placed above the filter pack and were hydrated using potable water. The remainder of the well was grouted to the surface and was completed at ground level with a protective casing, a sloped concrete pad, and a locking well cap. A copy of the State of Texas Well Reports (form WWD-012) and the well construction details for monitor wells MW-7 through MW-12 are contained in Appendix B.

Wells were developed at least 24 hours after completion using a bailer. Wells were bailed until the water was clear. All development water was contained in 55-gallon drums.

c. Depth Groundwater Encountered. The depth at which groundwater was encountered during drilling was first noted by the driller based on the drilling action. The depth was then verified by observing and measuring the wet portion of the Shelby sample obtained, and measuring the water level in the boring. Water was encountered at 10 feet in MW-7, at 14 feet in MW-8, at 18 feet in MW-9, at 20 feet in MW-10, at 24 feet in MW-11, and at 12 feet in MW-12. All water levels rose anywhere from 2 to 5 feet in the well borings after their completion.

d. Groundwater Sampling Procedures. Groundwater sampling

was performed by COE personnel for all 16 monitor wells beginning on 3 January and ending on 6 January 1994. All wells were sampled for BTEX, methyl tertiary butyl ether (MTBE), TPH and Pb. The six newly installed wells were also sampled for TDS. The five wells MW-3, BSS-B, SAV-2, MW-1, and MW-10 were also sampled for volatile organic compounds (VOCs) and polycyclic aromatic hydrocarbons (PAHs). The VOC and PAH analyses were selected for these five wells to obtain a greater amount of chemical data along the most direct migration route of the release, including background data from MW-3. The VOC analysis was also selected to determine if trichloroethene (TCE) or any of its degradation products was present because a TCE plume is currently being investigated west and upgradient of the BSS site.

Historical groundwater sampling data from the May 1993 COE sampling event were used to develop the sampling plan to sample all wells in as short a time as possible. All well sampling information was recorded on both a Well Sampling Daily Worksheet and a Water Samples Field Data Form. Completed forms are contained in Appendix B.

Prior to purging, each well was checked for floating free product using gasoline gauging paste. No free product was found in any of the wells. Water levels were then measured and were recorded to the nearest 0.01 foot.

Purging was performed using a portable hand bailer for all wells except MW-1 and MW-2, which were purged using a portable purge pump. Purge water was collected in 55-gallon drums. A minimum of three casing volumes of water were removed from each well prior to sampling. If a well purged dry prior to removing three volumes of water and was slow to recover, the well was sampled as soon as recharge was adequate to fill all sample containers. Most wells recharged quickly enough to

allow for 3 volumes of water to be removed in a relatively short period of time (i.e., less than 30 minutes). Quick recharge allowed for most wells to be sampled within 6 hours of purging. Only two wells, SAV-1 and SAV-2, were allowed to set overnight after purging and prior to sampling.

2. **Groundwater Analytical Data Table.** Water samples were analyzed using EPA Methods 8020 for BTEX and MTBE, 8240 for VOCs (including BTEX and MTBE), 418.1 for (TPH), 7421 for Pb, 160.1 for TDS, and 8310 for PAH. The analytical results and their distribution for the 16 wells sampled are shown on Table 7. Included in this table are the date each sample was collected, the well sample number and corresponding laboratory I.D. number for each sample, the analytical method used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix B. Analytical results are discussed in Section IV.

3. **Groundwater Elevation and Phase-Separated Product Thickness Measurements.** Besides the two groundwater sampling events performed by the COE in May 1993 and in January 1994, water level measurements were recorded by the COE twice in October 1993. The first round of measurements in October were recorded after a heavy rainfall at the beginning of the month. The second round in October was recorded while surface water and shallow soil sampling were being performed for the site. The October measurements were made to help determine how much fluctuation could be expected to design the length of setting of well screens properly. All four rounds of groundwater elevation measurements are shown on Table 6.

4. **Groundwater Gradient Map.** A groundwater gradient map for

water level measurements recorded for the January 1994 groundwater sampling event is shown on Figure 8. The predominant direction of groundwater flow is to the east-southeast across the site. The groundwater gradient is about 1 foot per 25 feet, or 0.04, across most areas of the site, but is steepest in the area adjacent to the BSS at 4 feet per 25 feet, or 0.16.

5. **Hydrocarbon Distribution Map.** Two figures are provided to show the dissolved phase hydrocarbon distribution across the site. Figure 9 depicts the BTEX in the groundwater. Figure 10 shows the TPH distribution.

C. **Surface Water Assessment.** The groundwater gradient determined during the May 1993 sampling event indicated groundwater to be discharging to the West Fork of the Trinity River at the petroleum hydrocarbon seep location. A shallow soil sample obtained by the COE at the river seepage area in May 1993 showed TPH and PAH contamination, therefore making the river a threatened surface water body. Results from the surface water sampling performed by the COE in May 1993 also confirmed surface water in the ditches adjacent to the service station to be contaminated with petroleum hydrocarbons.

To better characterize the nature of the surface water contamination occurring at the BSS site, the COE selected three locations along surface drainage paths for collecting both a surface water sample and a shallow soil sample in an attempt to determine if contaminated groundwater from the BSS release was discharging and impacting surface water leaving the site. The COE also collected another shallow soil sample from the seepage area along the West Fork of the Trinity River.

1. Description of Threatened or Impacted Surface Water Bodies.

a. West Fork of the Trinity River. A seepage area along the west bank of the West Fork of the Trinity River where petroleum hydrocarbons were bubbling into the water was first noted by Air Force personnel in April 1992. This seepage area is shown on Figures 1 and 11. Beginning at the dam on Lake Worth, the river flows southward past the Fort Worth National Fish Hatchery immediately downstream of the dam, past the YMCA Camp Carter, and past the spring-fed Burger Lake Recreation Area, where it then begins to flow along the eastern edge of CAFB for a distance of approximately 1 mile. Past CAFB, the river eventually turns eastward towards downtown Fort Worth where the Clear Fork of the Trinity River feeds into it. The West Fork of the Trinity River continues to flow eastward to Irving, where it converges with the Elm Fork of the Trinity River. The West Fork of the Trinity River in Tarrant County is under the jurisdiction of the Tarrant County Water Control and Improvement District.

b. Surface Drainage Ditches. Surface drainage ditches border the eastern and southern ends of the BSS, as shown on Figure 1. The eastern ditch runs parallel to and along the western edge of Rogner Drive, and the southern ditch runs along the northern side of Jennings Drive. The eastern ditch begins north of the BSS area and flows south. The southern ditch begins west of the BSS area and flows east. The flow from both of these ditches converge with the flow from other surface drainage ditches at the intersection of Rogner Drive and Jennings Drive. The combined flows are then diverted eastward for approximately 500 feet, where they leave CAFB and discharge into the West Fork of the Trinity River. A map illustrating these flow paths on a larger scale is shown on Figure 11.

The eastern ditch begins collecting surface runoff north of the BSS as well as from the BSS and adjacent Rogner Drive as it flows southward. The ditch is unlined in the immediate vicinity of the BSS except for a metal culvert which runs under the eastern driveway of the station. It is along the gravel bed underlying this culvert where groundwater begins to surface, seeping into the culvert at the metal seams and collecting towards the southern end. An odor of gasoline is almost always present within this culvert. It is not unusual during dry periods to find no water present in the northern end of this drainage ditch but to find the southern end saturated or ponded with water smelling of gasoline or exhibiting a sheen. Groundwater surfaces in the unlined portion of the southern end of the ditch, where there is frequently an orange slime on the soil and vegetation, presumably due to bacteria feeding on the petroleum hydrocarbons.

The southern ditch begins collecting surface runoff west of the BSS as well as from the BSS and adjacent Jennings Drive as it flows eastward. The ditch runs underground west of the BSS and emerges immediately south of the service station into a concrete-lined basin. Groundwater along the northern bank of this basin can be observed discharging above the limits of the concrete lining.

Groundwater can also be observed seeping in the driveway and within the surface drainage ditch adjacent to the driveway of Bldg. 1501, located northwest of the intersection of A Street and Knights Lake Road, as shown on Figure 11. There is typically orange staining and orange slime present along the surface of the asphalt where the groundwater is emerging through cracks and within the unlined portion of the ditch north of the driveway. This water flows eastward along the unlined ditch to a drop culvert which directs the flow underground

to the southern drainage ditch at the BSS.

2. Surface Water Impact Delineation Procedures.

a. West Fork of the Trinity River. The seepage area along the river bank was sampled by the COE in May 1993 at locations SW-1 and SED-1 to verify the nature of the contamination occurring. The soil sample SED-1 was not obtained at depth at a location approximately 5 feet above the surface of the river at that time. The location was selected based on the strong gasoline odor emanating from the soil. Riprap covering the slope made it difficult to obtain a sample at depth. The sample was analyzed for BTEX, TPH and PAH. TPH and some PAH compounds were detected. The water sample SW-1 was collected immediately downslope of SED-1 and was analyzed for BTEX, MTBE, and TPH. There was no evidence of petroleum contamination in the water at the time of sampling, and no contaminants were detected in the laboratory analyses.

Only one sample was collected at the river seepage area by the COE during this sampling effort. This was a shallow soil sample was collected on 28 September 1993 3 days after a heavy rain. It was taken from a depth of 1 foot at a location immediately above the water surface of the river where a very strong petroleum odor was noted. This location is shown on Figure 1. The Soil Sampling Field Data Sheet documenting sample location conditions at the time of sampling is contained in Appendix C.

No bubbling was ever observed during the several visits made to the river by COE personnel to observe the seepage area. A black oily sheen could be generated in the water by poking the soil river bottom with a stick. A rainbow sheen was occasionally noted in very small isolated areas along the river bank where there was standing water;

however, there was never enough of a sheen present to sample. During every visit to the seepage area, a gasoline odor was noted and the current seepage location could be identified by disturbing the soil along the bank. There were no visible impacts to biota present. Seepage was always noted occurring within the approximate 65-foot length of bank shown on Figure 1 at or just above the current level of the river.

b. Surface Drainage Ditches. Surface water sampling was performed by the COE in May 1993 along the surface drainage paths leaving the BSS to determine if the surface water was contaminated by the release. Surface water samples were collected at locations SW-2 through SW-5, which are shown on Figure 1. Results for BTEX, MTBE, and TPH analyses showed only the SW-2 and SW-3 locations to be contaminated. The source of contamination for SW-2 was likely groundwater contaminated by the BSS release discharging into the eastern drainage ditch. The source of TPH contamination detected at the SW-3 location, however, was not known because the SW-3 water sample was taken at the mouth of the drainage pipe and represented surface water collected upstream of the site. No soil samples were taken by the COE in May 1993 in any of the surface drainage ditches.

Four locations were selected for surface water and shallow soil sampling by the COE during this study to better determine how contaminated groundwater from the BSS was affecting surface drainage from the site. Surface water samples were designated with the prefix "SW" and shallow soil samples, obtained at a depth of 1 foot, were designated with the prefix "SED." All SW and SED sample locations except for SW-5A and SED-5A are shown on Figure 1. Locations SW-5A and SED-5A are shown on Figure 11. Soil Sampling and Surface Water

Sampling Field Data Sheets documenting sample location conditions at the time of sampling are contained in Appendix C.

Sample location SW-2A was located in the unlined portion of the eastern ditch where groundwater was observed seeping into the ditch and leaving an orange slime on the vegetation. A shallow soil sample, SED-2A, was also collected at this location. Sample location SW-3A was once again at the eastern end of the culvert where it discharges into the southern drainage ditch. This sample was collected to determine the degree of contamination occurring in runoff collected west of the site and to verify May 1993 test results. There was no shallow soil sample SED-3A collected because the location of SW-3A was concrete-lined. Surface water sample location SW-4A was selected on the northern bank of the southern drainage ditch to collect groundwater from the BSS which was discharging into the ditch. A shallow soil sample SED-4A was also collected at this location immediately above the concrete lining on the bank. Sample locations SW-5A and SED-5A were taken upstream of the drainage collected in the southern drainage ditch to determine if the seepage occurring at Bldg. 1501 was contaminated and was contributing to the contamination found in May 1993 in SW-3.

Sampling of these areas was performed on 22 October 1993 after a heavy rain in an attempt to capture a higher concentration of contaminants which would be migrating due to recharge. Water samples were collected directly into the sample containers. Soil samples were collected at a depth of 1 foot using a clean sharpshooter shovel. Other than the orange slime noted at the groundwater seeps at SED-2A and SED-5A, no visible impacts to the biota were noted.

3. Surface Water and Shallow Soil Analytical Results. The shallow soil sample SED-1A was collected from the bank of the West Fork of the Trinity River on 28 September 1993. This sample was analyzed using EPA Methods 8240 for VOCs and BTEX, 418.1 for TPH, 7421 for Pb, and 8310 for PAH. The results for these analyses are shown on Table 8. Included on this table is the date the sample was collected, the field sample number and corresponding laboratory I.D. number for each sample, the analytical methods used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and the chain of custody form are contained in Appendix C. Analytical results are discussed in Section IV.

Surface water samples were collected by COE personnel on 22 October 1993 at locations SW-2A, SW-3A, SW-4A, and SW-5A. These water samples were analyzed using EPA Method 8240 for VOCs and BTEX, 418.1 for TPH, 7421 for Pb, and 8310 for PAH. The analytical results and are shown on Table 9. Included in this table are the date each sample was collected, the location number and corresponding laboratory I.D. number for each sample, the analytical method used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix C. Analytical results are discussed in Section IV.

Shallow soil samples were collected on 22 October 1993 at locations SED-2A, SED-4A, and SED-5A. These soil samples were also analyzed using EPA Methods 8240 for VOCs and BTEX, 418.1 for TPH, 7421 for Pb, and 8310 for PAH. The analytical results are shown on Table 10. Included in this table are the date each sample was collected, the location number and corresponding laboratory I.D. number for each

sample, the analytical method used, and the results obtained. All concentrations above detection limits are shaded. Signed copies of the laboratory reports and chain of custody forms are contained in Appendix C. Analytical results are discussed in Section IV.

4. Surface Water Impact Map. A map showing the surface water sample locations and corresponding analytical data for both surface water and shallow soil samples collected during this sampling effort is shown on Figure 12. The areas where contaminated groundwater is discharging to surface water are also delineated on Figure 12. The analytical results for samples SW-5A and SED-5A are shown on Figure 11.

D. Waste Management and Disposition.

1. Storage, Treatment, or Disposition Methods. All investigative-derived wastes (IDW) generated by the COE as part of this investigation were containerized in clean 55-gallon steel drums. Soil was contained in open-topped drums. Development and purge water were contained in close-topped drums. Each drum containing soil or water was labeled with the project name, boring number(s), and date the waste was contained.

Drums containing IDW generated during the soil boring investigation in December 1992 were temporarily stored at the COE facilities at the Federal Center on Felix Street in Fort Worth. The soil was disposed of at the City of Garland Municipal Landfill on 1 June 1993 by Innovative Support Group, Inc. The purge water was disposed by Mobley Company at the Mobley Company Corsicana Fuel Facility on 7 July 1993. Copies of the manifests are contained in Appendix D.

Drums containing IDW generated during the installation of wells

MW-7 through MW-12 were moved to the Bldg 1190 hazardous waste storage yard on CAFB for temporary storage on wooden pallets until test results were received for determining final disposition. The COE contracted with Innovative Support Group, Inc., in Dallas, TX, to dispose of all containers of waste generated from this investigation. The well water was disposed by Mobley Company at the Mobley Company Corsicana Fuel Facility on 6 May 1994. The soil was disposed at CSC Disposal and Landfill, Inc., in Avalon, TX, on 9 May 1994. Copies of the manifests are contained in Appendix D. Manifests contain additional quantities of soil and water from a LSA investigation recently performed for Bldg 1628 (LPST ID No. 106684) at CAFB.

2. Volume and Disposition of Contaminated Soil. Three 55-gallon drums of contaminated soil were generated during the drilling and sampling of soil borings ST16-1, ST16-2, and ST16-3. A total of 17 55-gallon drums of contaminated soil were generated from the drilling of well borings MW-7 through MW-12.

3. Volume and Disposition of Contaminated Groundwater. Five 55-gallon drums of petroleum contaminated groundwater were generated from the purging of soil borings ST16-1, ST16-2, and ST16-3 prior to obtaining groundwater grab samples. A total of 14 55-gallon drums of petroleum contaminated groundwater were generated from the development and purging of wells BSS-A, BSS-B, SAV-1, SAV-2, and MW-1 through MW-12.

4. Volume and Disposition of Phase-Separated Product. No phase-separated product was found in any of the wells installed or sampled.

TAB

SECTION IV

SECTION IV
CONCLUSIONS AND RECOMMENDATIONS

A. Summary of Findings.

1. **Magnitude and Extent of Soil Contamination.** Results from soil sampling performed during the UST removal, during the drilling and sampling of soil borings ST16-1, ST16-2, and ST16-3, and during the drilling and sampling of well borings MW-7 through MW-12 indicate the source of petroleum hydrocarbon contamination for the BSS site was the entire UST system at the BSS.

Soil samples from the tank excavation found TPH as high as 630 ppm and BTEX as high as 1119 ppm along the southeast wall in sample 1518-D-SEW. The distribution of TPH and BTEX contaminants within the excavation indicated no petroleum hydrocarbons present along the western (NW) wall (samples 1518-A-SWW and 1518-A-NWW) and the northwestern corner (sample 1518-A-NW) of the excavation, and the highest concentrations of both TPH and BTEX along the eastern wall of the excavation. The approximately 150 cubic yards of excavated soil had a maximum concentration of TPH at 47 ppm and a maximum concentration of BTEX at 34.6 ppm. The contaminated soil removed from the tank excavation was used to backfill the tankhold, and therefore continues to provide a source of contaminants.

The soil samples collected from the three soil borings located along the fuel lines leading to the fuel dispensers indicated TPH present at concentrations as high as 79 ppm at the depth ranging from 2 to 3 feet (soil sample ST16-3-1) and as high as 216 ppm at the depth ranging from 4 to 4.7 feet in the same boring (ST16-3-2). All soil samples were obtained from the vadose zone and all detected TPH above the detection limit of 20 ppm. The TCLP analyses performed for the

BTEX compounds for the samples obtained from the vadose zone found no TCLP benzene concentrations exceeding the maximum concentration of contaminants for the toxicity characteristic of 0.5 mg/l; however, all soil samples exhibited detectable concentrations for the BTEX compounds using the TCLP method for analysis.

Soil samples obtained during the drilling and sampling of well borings MW-7 through MW-12 found no additional sources of petroleum hydrocarbon contamination. The vertical distribution of TPH and BTEX concentrations in the soil samples collected from these borings generally coincided with the depth groundwater occurred in each of the borings. Trace amounts of BTEX compounds were detected in the soil samples obtained from the vadose zone. The exception was well boring MW-11 in which TPH was detected not only in the vadose zone at 52.7 ppm, but also at 48.6 ppm at the groundwater interface and at 51.7 ppm at the final depth of the boring. Soil samples taken from the saturated zone at the final depth in well borings MW-7 and MW-8 also detected TPH at concentrations of 30.5 and 33.9 ppm, respectively, just above the detection limit of 30 ppm. A false positive TPH reading can occur using EPA Method 418.1 if TCE is present.

The soil sample analytical data indicate soil contamination from the UST release extends from the areal extent of the tank excavation along all associated fuel lines to the shallow depth at which groundwater occurs in the immediate area of the BSS. The full lateral extent of soil contamination, although not investigated, likely does not extend much further than the physical extent of the UST system. Concentrations of TPH are as high as 630 ppm within the tank excavation and as high as 216 ppm along the fuel lines. Concentrations of BTEX are as high as 1119 ppm within the limits of

the tank excavation and are present in the vadose zone along the fuel lines.

2. Impact on Groundwater. Groundwater occurs at the shallow depth of 5 to 7 feet along the extent of the UST system. The tanks were situated within ground water, and the fuel distribution lines are within 2 to 3 feet of the groundwater surface. Releases along the fuel lines and from the USTs directly impacted groundwater creating a groundwater contaminant plume which extends westward past the installation boundary to the West Fork of the Trinity River.

The lateral extent of the groundwater contaminant plume is defined by monitor wells MW-3 in the upgradient direction, MW-7 north and cross-gradient to the former tank locations, MW-12 northeast of and cross-gradient to the former UST system, MW-11 east-southeast and downgradient of the UST release, and MW-8 south-southeast in a cross-gradient direction of the release. Petroleum hydrocarbon concentrations, except for MTBE, were below detection limits in each of these wells. Well MW-8 detected MTBE at a concentration of 200 ug/l, but found no BTEX or TPH.

Direction of groundwater flow is east-southeast at a gradient of about 1 foot per 25 feet, or 0.04, across much of the area encompassed by the plume, but is steepest in the area adjacent to the former tank location at a gradient of 4 feet per 25 feet, or 0.16.

Two areas of high concentrations of dissolved TPH and BTEX are defined within the extent of the plume. The highest concentrations of each of these constituents occur north of and adjacent to the tank excavation, where TPH was found at a concentration of 20 mg/l in BSS-B and BTEX was found at a concentration of 45.88 mg/l in the same well. According to CAFB records, this well once contained several inches of

free-phase product. No free-phase product was found during any sampling performed during this investigation.

The other area of high concentration for both of these constituents is along a line directly downgradient from the former tank location. This area of high concentrations of dissolved TPH and BTEX extends roughly from the location of well SAV-2 eastward and downgradient to the location of well MW-10. The concentrations of TPH in wells SAV-2 and MW-10 within this high were 9.0 and 9.8 mg/l, respectively. The concentrations of BTEX in each of these wells was 11.540 mg/l in SAV-2 and 46.070 mg/l in MW-10. These contaminant concentration contours configure to the direction of groundwater flow from the former tank location and line up directly with the seepage area at the river. Groundwater elevations strongly indicate recharge to the river is occurring where the contaminated seepage has been observed.

Other parameters analyzed were Pb, PAHs, and VOCs. Concentrations of Pb were elevated as high as 41 ug/l in wells exhibiting the highest concentrations of petroleum hydrocarbons. The PAH compounds acenaphthylene and naphthalene were found in the four downgradient wells sampled for this parameter (BSS-B, SAV-2, MW-1, and MW-10) at the maximum concentrations of 454 ug/l and 713 ug/l, respectively. No VOC compounds were found in the same four downgradient wells sampled; however, the high concentrations of BTEX compounds present in these wells required dilution of the samples which may have masked lower concentrations of VOCs if present. The parameters pH and conductivity were measured in the field during sampling. The range of pH was 7.31 to 9.12. Conductivity ranged from 793 to 1222 umhos/cm.

3. Impact on Surface Water. Groundwater is discharging to surface water at two locations within the limits of the BSS study area. One area is south-southeast of the fuel islands and the other area is along the west bank of the West Fork of the Trinity River.

Groundwater grab samples from the three soil borings drilled along the fuel distribution lines were contaminated with BTEX as high as 4.770 mg/l and TPH as high as 14 mg/l. The vertical distribution of soil contamination in the soil borings indicated the groundwater at the fuel line locations was impacted by releases along these lines. This impacted groundwater is discharging to the surface water drainage the area south-southeast of the fuel islands which is in a cross-gradient direction from the tank excavation but in a locally downgradient direction from the fuel distribution lines.

The groundwater discharging in this seepage area was contaminated with BTEX at a concentration of 225.7 ug/l where it was discharging at the south end of the BSS culvert (SW-2A). Soil at two locations (SED-2A and SED-4A) within this seepage area contained TPH as high as 210 ppm and several PAH compounds ranging from below detection limits to as high as 6.240 ppm. No BTEX was found in the soil samples collected, and no TPH was found in the water samples collected.

Investigation of a possible upgradient source to the 1.1 mg/l of TPH previously identified in sample SW-3 in May 1993 indicated no petroleum hydrocarbons present in either the surface water sample or soil sample collected upstream near Bldg. 1501. No TPH was identified in SW-3A during this investigation, indicating the TPH identified by the COE in the July 1993 report may be questionable.

Previous surface water sampling in May along the surface drainage path further downstream of the BSS indicated no petroleum hydrocarbon

contamination was present (SW-4 and SW-5). These locations are along the surface drainage path which ultimately discharges to the West Fork of the Trinity River. It is unlikely the surface water discharging to the West Fork of the Trinity River along this surface drainage path is remains impacted by the BSS release.

The one shallow soil sample collected from the seepage area at the West Fork of the Trinity River exhibited an extremely high concentration of BTEX at 1,147 ppm. The highest constituent concentration of total BTEX was xylenes at 742 ppm. Naphthalene was the only PAH compound detected at 36 ppm. The TPH concentration was 130 ppm. Observations at various river levels over several months indicate the elevation of the seepage area rises and falls with the groundwater levels across the site. No observations were made indicating contaminated surface water in the river other than being able to generate a black oily sheen when poking the river sediment, when attainable, with a stick.

Although high concentrations of petroleum hydrocarbons within the shallow soil from the river seepage indicate groundwater contamination from the BSS extends as far east as the West Fork of the Trinity River, it is not known at what concentrations the groundwater is discharging to the river itself to be able to determine the impact on this surface water body. The concentrations of TPH and BTEX in MW-10, the closest upgradient well to the seepage area, indicate groundwater contaminant concentrations could be as high or higher than 9.8 mg/l for TPH and 46.070 mg/l for BTEX.

4. Other Potential Impacts and Future Risks. It has been determined groundwater contaminated by the gasoline release from the BSS is discharging to the West Fork of the Trinity River. It has also

been determined groundwater contaminated by the release is discharging to surface drainage paths which ultimately drain to the river. The greatest risk appears to be exposure to contaminated surface water within the surface drainage ditch at the BSS and along the flow of the West Fork of the Trinity River.

Although the horizontal extent of the petroleum hydrocarbon contaminant plume has been defined, the vertical extent of contamination has not been determined to verify whether the groundwater contamination poses a threat to any drinking supply wells in the area. It appears contamination extends only to the base of the upper groundwater zone occurring in the alluvial deposits on CAFB and not to the much greater depths within the Paluxy Formation where the area's drinking supply wells are developed. The closest drinking water supply wells to the BSS are situated approximately 0.5 mile east of the site on the other side of the river.

B. Recommendations. Further actions at the site should address reducing or eliminating remaining sources of contaminants, mitigating off-site migration of contaminants, determining the vertical extent of groundwater contamination, verifying the presence or absence of VOCs other than BTEX compounds in the groundwater, and performing a risk assessment to determine final cleanup levels for the site.

1. Contaminant Sources. Contaminated soil within the tank excavation and along the abandoned fuel distribution lines contains high concentrations of petroleum hydrocarbon contaminants which continue to be released to the shallow groundwater in this area of the site. The amount of contaminated soil is of limited horizontal and vertical extent. This continuing source of groundwater contamination should be removed or treated to aid in mitigating off-site migration

of contaminants. Removal or treatment will also aid in reducing the contaminant levels of groundwater discharging to surface drainage on-site.

2. Off-Site Migration. Groundwater flow is the primary migration pathway leading from the source at the UST system off-site to the West Fork of the Trinity River, where petroleum contaminants are being released to surface water. Contaminant concentrations in the groundwater are high along the installation boundary. These concentrations should be reduced. Removal or treatment of contaminated soil acting as a source of groundwater contamination should be performed in conjunction with treatment of groundwater migrating across the installation boundary.

3. Vertical Extent. The installation and sampling of cluster monitor wells at the site should define the vertical extent of groundwater contamination to determine if there is any threat to deeper aquifer drinking water supply wells in the area. Information from these wells will also aid in designing a system to best treat contaminants migrating off-site.

4. Volatile Organic Compounds. A TCE plume underlies the western portion of CAFB. The easternmost extent of the plume has not been fully delineated. Other potential TCE sources on CAFB are being investigated as part of the effort to fully delineate the extent of the TCE plume(s). The presence or absence of TCE at the BSS site should be verified by sampling wells which have exhibited no or low concentrations of BTEX compounds and analyzing for VOCs using EPA Method 8240. Wells to be sampled should include MW-7, MW-8, and MW-11 where TPH was found in soil samples collected at depth within the saturated zone.

5. Risk Assessment. Once the source of contamination is eliminated or reduced, concentrations of contaminants migrating off-site are mitigated, and all contaminant migration pathways are verified, a risk assessment should be performed to determine the impact of reduced contaminant concentrations on health and the environment. Information obtained from the risk assessment should then be used to determine the extent to which the site should be remediated.

SECTION II

SECTION VI
QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

A. Sample Collection Procedures.

1. **Soil Borings.** Quality assurance/quality control (QA/QC) procedures followed for obtaining soil samples and groundwater grab samples from soil borings ST16-1 through ST16-3 consisted of obtaining one duplicate soil sample from ST16-1 for sample ST16-1-1 from 2 to 3 feet for QC analysis, obtaining one duplicate soil sample from ST16-2 for sample ST16-2-1 from 2 to 3 feet for QA analysis, obtaining one rinsate sample, and preparing one trip blank which accompanied the shipment of soil samples to the laboratory. There were no QA/QC procedures followed for obtaining the three groundwater grab samples from the soil borings the day after the borings were completed. The laboratory report discussing the validity of the soil and groundwater analyses based on the QA/QC data obtained for these three soil borings is provided in Appendix A.

2. **Soil Gas Survey.** The QA/QC procedures followed by TARGET for collecting soil gas samples are documented in the soil gas survey report contained in Appendix A.

3. **UST Removal.** Quality assurance/quality control procedures followed for collecting soil samples and the groundwater sample for the UST removal consisted of taking one triplicate soil sample at location CAFB-1518-B-NW, taking one rinsate sample, and preparing one trip blank to accompany the single shipment of samples to the laboratory. The QA soil sample was shipped to the COE SWD Lab in Dallas, TX, as a check on the contractor's laboratory results. The QA report for sample CAFB-1518-B-NW/QC is contained in Appendix A. The rest of the QA/QC data for the UST samples are contained in the PWI

1993 report.

4. Well Boring, Groundwater, Surface Water, and Shallow Soil Samples. Quality assurance/quality control (QA/QC) procedures followed for collecting soil and water samples for the monitor well installation, groundwater sampling, and surface water sampling portions of this investigation were developed in accordance with Department of the Army, US Army Corps of Engineers, ER 1110-1-263, Chemical Data Quality Management for Hazardous Waste Remedial Activities, dated 1 October 1990. Standard QA/QC procedures for collecting these samples require one duplicate/split for every 10 samples taken per analytical parameter per matrix for both QA and QC. All QA and QC samples were labeled as blind samples when sent to the laboratory for analysis. Rinsate samples (equipment blanks) for non-dedicated equipment are required to be taken at a frequency of once per every 20 samples per analytical parameter per matrix. Trip blanks are prepared at a frequency of one per shipping cooler per day, and accompany water samples only. If possible, it is always desirable that the QA, QC and rinsate samples all be prepared for a single contaminated field sample to provide the most QA/QC data as possible.

Following these standard procedures, a QA/QC sampling plan for each sampling event was developed. A total of 18 soil samples were collected from the drilling of well borings MW-7 through MW-12. Therefore, two triplicate samples were taken for performing QA and QC analyses for each parameter. One rinsate sample was also collected for each of the triplicate samples taken. No trip blanks were prepared for the soil samples. The sampling plan for soil sampling showing the distribution of QA/QC samples for the well borings is shown on Table 11.

Obtaining true replicates of soil samples is always difficult because of the non-homogeneity of the material. It was more difficult during this investigation because of the number of containers to be filled from a small diameter sampler. Therefore, only one parameter was split at a time, as shown in Table 11. Replicate samples for a given sampled interval were taken by splitting the sample core into equal sections lengthwise for the required number of jars. Replicate samples for BTEX/MTBE were obtained in boring MW-7 for FS-2 from 6.5 to 8.0 feet, and in boring MW-11 for FS-2 from 20 to 22 feet. Replicate samples for TPH were obtained in well boring MW-8 for FS-2 from 10 to 12 feet, and in boring MW-10 for FS-2 from 16 to 18 feet. Because the sampling was performed at 2-foot intervals, it was necessary to anticipate when a soil sample would be retained for analysis; therefore rinsate samples were not always prepared for the run made to collect the replicate soil sample. A rinsate sample was prepared by running distilled water over the decontaminated sampler and collecting it in the appropriate container(s) to be analyzed. The laboratory report discussing the validity of the soil sample analyses based on the QA/QC data obtained is provided in Appendix A.

A total of 16 groundwater samples were collected from the 16 monitor wells sampled. Therefore, two triplicate samples were taken for performing QA and QC analyses. These were collected from well MW-1, known to be contaminated, and from well MW-10, suspected to be contaminated. No rinsates were collected during ground-water sampling because new disposable equipment was used to sample each well. Four trip blanks accompanied the four shipments of groundwater samples to the laboratory. The groundwater sampling plan showing the distribution of QA/QC samples for the groundwater sampling event is

shown on Table 12. The laboratory report discussing the validity of the groundwater sample analyses based on the QA/QC data obtained is provided in Appendix B.

The single shallow soil sample SED-1A collected from the seepage area along the West Fork of the Trinity River had no replicate samples taken for QA and QC analyses because it was a single soil sample which was hand delivered to the SWD Lab the same day it was collected. A discussion of the internal QA/QC laboratory information for this soil sample is contained in Appendix C.

A total of four surface water samples were collected during the surface water sampling event. Therefore, one triplicate sample was taken for QA and QC analyses. This sample was taken from the known contaminated SW-2A location. No rinsates were prepared because the water sample was collected directly into the sampling container. One trip blank accompanied the one shipment of water samples to the laboratory. The sampling plan showing the distribution of QA/QC samples for the surface water sampling event is shown on Table 13. The laboratory report discussing the validity of the surface water sample analyses based on the QA/QC data obtained is provided in Appendix C.

A total of four shallow soil samples were collected during the surface water sampling event. Again, one triplicate sample was taken for QA and QC analyses. This sample was also taken from the known contaminated SW-2A location. One rinsate was prepared prior to obtaining soil sample SED-2A. No trip blanks were necessary for soil samples. The sampling plan showing the distribution of QA/QC samples for the soil samples collected during the surface water sampling event is shown on Table 14. The laboratory report discussing the validity

of the surface water sample analyses based on the QA/QC data obtained is provided in Appendix C.

B. Sample Handling Procedures.

1. Soil Borings.

a. Soil Samples. Soil samples were taken using a clean 5-foot long 6-inch diameter split barrel sampler. The sampler was steam-cleaned prior to entering the boring. Each soil sample was placed in two 8-ounce glass jars with teflon-lined lids. One jar was labeled for TPH analysis and one jar was labeled for TCLP Pb and BTEX analyses. All jars were filled completely, disturbing the soil as little as possible. Each jar was labeled with the project name, boring number, sample number, sample interval, date and time of sampling, analysis, analytical test method number, and signature of the sampler. Samples were placed on ice, sealed in ice chests with appropriate chain of custody forms, and were hand delivered to SWD Lab in Dallas, TX, within 24 hours of being taken.

A rinsate sample was collected in one 40-ml glass vial at some time during drilling and sampling of the soil borings. The sample was labeled for BTEX analysis. A trip blank was also prepared for shipment with the soil samples which consisted of one 40-ml glass vial of water labeled for BTEX analysis. No other information is available for how and when these blanks were prepared.

There were several problems with preservation and documentation procedures for the handling and shipment of these samples to the laboratory. These problems are noted in the laboratory QA/QC discussion in Appendix A.

b. Groundwater Grab Samples. Prior to obtaining a grab sample of the groundwater in each of the soil borings, three volumes

of groundwater were purged from each boring using a clean bailer. Once groundwater had recovered enough to obtain the required samples, samples were collected using a clean disposable teflon bailer. Each sample consisted of two 40-ml glass vials labeled for BTEX analysis, one 1-liter plastic bottle labeled for TDS analysis, one 1-liter amber glass bottle labeled for TPH analysis, and one 1-liter plastic bottle labeled for Pb analysis. The TPH samples were preserved with HCl added to lower the pH to <2. The Pb samples were preserved with HNO₃ added to lower the pH to <2. All containers were labeled with the project name, boring number, analysis, analytical test method number, preservation used, data and time of sampling, and signature of sampler. Containers were placed on ice and were hand delivered to SWD Lab in Dallas, TX, the same day as they were taken.

The groundwater grab samples were delivered together with the soil samples to SWD Lab and experienced the same types of preservation and documentation problems noted in the laboratory QA/QC report contained in Appendix A.

2. Soil Gas Survey. Sample handling procedures used by TARGET in performing the soil gas survey are documented in the soil gas survey report contained in Appendix A.

3. UST Removal. Each soil sample taken within the tank excavation was placed in a 4-ounce glass jar. Each jar was labeled for BTEX, TPH and Pb analyses. All jars were stored on ice until delivered to Chemron Incorporated in San Antonio, TX.

The one groundwater sample was taken using two 40-ml glass vials labeled for BTEX analysis, one 1-liter amber glass bottle labeled for TPH analysis, one 250-ml plastic bottle labeled for Pb analysis, one 250-ml amber glass bottle labeled for TOX analysis, and one 40-ml

glass vial labeled for pH and TDS analyses. The BTEX and TPH samples were each preserved by adding HCL to lower the pH to <2. A trip blank consisting of two 40-ml glass vials was prepared for BTEX analysis and accompanied the shipment of water samples. Included in this shipment was a rinsate sample prepared for sample location CAFB-1518-D-NW consisting of two 40-ml glass vials labeled for BTEX analysis and preserved with HCl to pH<2, one 1-liter amber glass bottle labeled for TPH analysis and preserved with HCl to pH<2, and one 250-ml plastic bottle labeled for Pb analysis. All water samples were stored on ice until delivered to Chemron Incorporated in San Antonio, TX, for analysis.

4. Well Boring, Groundwater, Surface Water, and Shallow Soil Samples.

a. Soil Samples from Well Borings. Soil samples were taken using a clean 5-foot long 6-inch diameter split barrel sampler. The sampler was steam-cleaned prior to entering the boring. Each soil sample was placed in two 8-ounce pre-cleaned glass jars with teflon-lined lids. One jar was labeled for BTEX/MTBE analysis, and one jar was labeled for TPH analysis. All jars were filled completely, disturbing the soil as little as possible.

Equipment blanks were prepared by running deionized water over the cleaned sampling tool prior to obtaining a soil sample. The water was collected in three 40-ml glass vials labeled for BTEX and MTBE analyses and in two 1-liter amber glass bottles labeled for TPH analysis. Water samples were preserved using HCL added to lower the pH<2.

Each sample container was labeled with the project name, boring number, sample number, sample interval, date and time of sampling,

analysis, analytical test method number, and signature of the sampler. Sample containers and preservation procedures are shown on Table 15. Samples were placed on ice, sealed in ice chests with appropriate chain of custody forms, and were delivered to the COE SWD Lab in Dallas, TX, within 24 hours of being taken.

b. Groundwater Samples from Monitor Wells. Each day, prior to sampling the wells, a travel blank was prepared for a VOC analysis using deionized water. The sample was labeled as a travel blank and was placed in the ice chest to accompany the day's shipment of samples.

A new clean disposable teflon bailer with a VOA tip was used to sample each well. Samples were collected from the top of the water column in the well in the order shown on Table 12. The number of containers for each sample, the type of containers for each sample, and the preservation procedures used are shown on Table 16. All containers were labeled with the project name, well number, analysis, analytical test method number, preservation used, date and time of sampling, and signature of the sampler. Containers were placed on ice and were shipped by bus to SWD Lab in Dallas, TX. Samples arrived at the lab within 24 hours of being taken.

c. Surface Water and Shallow Soil Samples. Prior to collecting surface water samples, a travel blank was prepared for a VOC analysis using deionized water. The sample was labeled as a travel blank and was placed in the ice chest in which the samples were shipped.

Surface water samples were collected directly into the appropriate sample container for the analysis to be performed. Sample containers and preservation procedures are shown on Table 17.

Soil samples were obtained using a clean sharpshooter shovel. The sampler was cleaned with soap and potable water prior to obtaining each sample. Each soil sample was then placed in three 8-ounce pre-cleaned glass jars with teflon-lined lids. One jar was labeled for BTEX/MTBE analysis, one jar was labeled for TPH analysis, and one jar was labeled for PAH analysis. All jars were filled completely, disturbing the soil as little as possible. Container and preservation procedures are shown on Table 17.

Equipment blanks were prepared by running deionized water over the cleaned blade of the shovel to obtaining a soil sample. The water was collected in three 40-ml glass vials labeled for VOC analysis, two 1-liter amber glass bottles labeled for TPH analysis, one 1-liter amber glass bottle labeled for PAH analysis, and one 1-liter plastic bottle labeled for Pb analysis. Preservation was performed in accordance with the procedures shown on Table 17.

Each sample container was labeled with the project name, boring number, sample number, sample interval, date and time of sampling, analysis, analytical test method number, and signature of the sampler. Samples were placed on ice, sealed in ice chests with appropriate chain of custody forms, and were delivered to the COE SWD Lab in Dallas, TX, within 24 hours of being taken.

C. Laboratory Procedures.

1. **Soil Borings.** The analytical methods used for soil samples obtained from soil borings ST16-1, ST16-2, and ST16-3 were EPA Method 1311 and 8020 for BTEX (TCLP), EPA Method 1311 and 6010 for Pb (TCLP), and EPA Method 418.1 for TPH. The maximum holding time for TCLP analyses for soil samples is 7 days for extraction and 6 months for the analysis. The maximum holding time for TPH is 28 days after

sampling.

The analytical methods used for the water samples obtained for these borings were EPA Method 8020 for BTEX, EPA Method 6010 for Pb, EPA Method 418.1 for TPH, and EPA Method 160.1 for TDS. The maximum holding times for these test methods are 14 days for BTEX, 6 months for Pb, 28 days for TPH, and 28 days for TDS.

2. Soil Gas Survey. The analytical method used for the soil gas samples obtained during the soil gas survey was EPA Method 602 Modified standardized for BTEX compounds. Procedures are explained in the soil gas report contained in Appendix A.

3. UST Removal. The analytical methods used for the soil samples collected during the UST removal were EPA Method 8020 for BTEX, EPA Method 9071/418.1 for TPH, and EPA Method 3050/7421 for Pb. The maximum holding times for these procedures is 14 days for BTEX, 14 days for TPH, and 6 months for Pb.

The analytical methods used for the water samples obtained for the UST removal were EPA Method 8020 for BTEX, EPA Method 418.1 for TPH, EPA Method 3005/7421 for Pb, EPA Method 160.1 for TDS, and EPA Method 9020 for TOX. The maximum holding time is 14 days for BTEX, 28 days for TPH, 6 months for Pb, 28 days for TDS, and 28 days for TOX. The EPA-approved methods used by the laboratory to analyze the groundwater samples taken were EPA Method 8240 to quantify VOCs, BTEX, and MTBE, EPA Method 418.1 for TRPH, EPA Method 8310 for PAH, and EPA Method 610.1 for TDS. The extraction method used for PAH was EPA Method 3520. The maximum holding times for these test methods are 14 days for VOCs, 28 days for TRPH, 40 days for PAH with extraction performed within 7 days of sampling, and 28 days for TDS.

4. Well Boring, Groundwater, Surface Water, and Shallow Soil

Samples. The analytical methods used for all soil samples collected during these sampling events were EPA Method 5030/8020 for BTEX and MTBE, EPA Method 8240 for VOC and MTBE, EPA Method 9071/418.1 for TPH, EPA Method 3051/7421 for Pb, and EPA Method 3520/8310 for PAH. The maximum holding times for these test methods is 14 days for BTEX/MTBE, 14 days for VOC/MTBE, 28 days for TPH, 6 months for Pb, and 40 days for PAH with extraction to be performed within 14 days of sampling.

The analytical methods used for all water samples collected during these sampling events were EPA Method 5030/8020 for BTEX and MTBE, EPA Method 8240 for VOCs and MTBE, EPA method 418.1 for TPH, EPA Method 7421 for Pb, EPA Method 160.1 for TDS, and EPA Method 3510/8310 for PAH. The maximum holding times for these test methods is 14 days for BTEX/MTBE, 14 days for VOC/MTBE, 28 days for TPH, 28 days for TDS, and 40 days for PAH with extraction to be performed within 7 days of sampling.

SOUTHWESTERN DIVISION LABORATORY, CORPS OF ENGINEERS
4815 Cass Street
Dallas, Texas 75235

SUBMITTAL OF SWDED-GL REPORT 15728-1

PROJECT: CARSWELL AFB - FTW
Feature: BASE SERVICE STATION

Contract No.

TEST REQUEST NO.: E87930087
Dated: 09 DECEMBER 1992
Received: 14 DECEMBER 1992

From: CHIEF, GEOTECHNICAL
BRANCH

MATERIAL: Six Soil Samples, Four Water Samples, One Quality Assurance Sample, One Quality Control Sample, and One Travel Blank

Travel Blank
Rinsate Blank
ST16-1 (WATER)
ST16-2 (WATER)
ST16-3 (WATER)
ST16-1-1 2'-3'
ST16-1-1-QC 2'-3'
ST16-1-2 3.5'-4'
ST16-2-1 2'-3'
ST16-2-2 4'-5'
ST16-3-1 2'-3'
ST16-3-2 4'-4.7'

Date Received: 3 December 1992

Remarks:

Report sent to:

FORT WORTH DISTRICT

Copy furnished:

Date:

JAN 12 1993

Name and title:
WILLIAM R. TANNER
Director
SWD Laboratory

Signature

DATE RECEIVED : 3-DEC-1992

REPORT NUMBER : D92-13813-1

REPORT DATE : 17-DEC-1992

SAMPLE SUBMITTED BY : US Army Corps of Engineers
ADDRESS : 4815 Cass St.
: Dallas, TX 75235-8011
ATTENTION : Ms. Janice Stewart

SAMPLE MATRIX : Liquid
ID MARKS : Travel Blank 2-4250
: Base Service Station
PROJECT : Carswell AFB (4250-4262)
DATE SAMPLED : 1-DEC-1992
ANALYSIS METHOD : EPA 8020
ANALYZED BY : RJD
ANALYZED ON : 15-DEC-1992
DILUTION FACTOR : 1

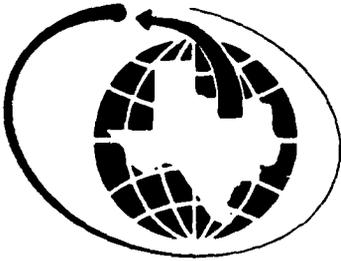

BTEX ANALYSIS			
TEST REQUESTED	DETECTION LIMIT		RESULTS
Benzene	1.0	µg/L	< 1.0 µg/L
Toluene	1.0	µg/L	< 1.0 µg/L
Ethyl benzene	1.0	µg/L	< 1.0 µg/L
Xylenes	1.0	µg/L	< 1.0 µg/L
BTEX (total)			< 1.0 µg/L #

QUALITY CONTROL DATA		
SURROGATE COMPOUND	SPIKE LEVEL	SPIKE RECOVERED
Bromofluorobenzene(SS)	50.0 µg/L	107 %

Based upon Good Laboratory Practice, the result is rounded to the appropriate number of significant figures.

COOLER RECEIPT FORM

Date Received 12-2-92 Project CARSWELL AFB
 Number of Coolers 3 District FT. WORTH
 Date Checked in 12-2-92 By (sign) Stanley A. Johns

1. Shipping bill number HAND DELIVERED
2. Custody seals on cooler NO
3. Custody seals intact.....Yes No N/A
4. Chain-of-Custody in plastic.....Yes No
5. Chain-of-Custody filled out properly.....Yes No¹
6. SWD signed Chain-of-Custody properly.....Yes No
7. Ice and packing ICE AND INSERTS IN 2 COOLERS, ONE COOLER W/O ICE
8. All bottles sealed.....Yes No
9. Any bottles broken.....Yes No
10. Labels in good condition and complete.....Yes No²
11. Labels agree with COC.....Yes No³
12. Correct containers used.....Yes No
13. Preserved properly.....Yes No
14. Sufficient sample.....Yes No
15. Bubbles absent from VOA.....Yes No
16. Client called.....Yes No

Details: _____

17. Comments: TWO COOLERS DELIVERED BY BOB BEAM, ONE COOLER DELIVERED BY
MEVEY (THIS ONE DID NOT HAVE ANY ICE). ① MAI TRAIL CALLED FRANK GREY TO FIND OUT
WHAT THEY REALLY WANTED. ② ③ ALSO SAMPLE # MISSING ON ONE C.O.C. ONE LABEL
ALL FOR SOIL SAMPLES SAY TCLP BUT NOT ON C.O.C.

I TALK TO FRANK GREY (15:10 pm) HE WANT TCLP / PB , TCLP / BTEX , T
 AND NO TDS)

CASE NARRATIVE

Six soil samples, four water samples, one Quality Assurance sample, one Quality Control sample, and one Travel Blank arrived at the Southwestern Division Laboratory on 2 December 1992 from Carswell Air Force Base - Base Service Station. The samples arrived with incomplete chain-of-custody forms. Sample numbers were missing, and the labels were mismatched with the chain-of-custody forms. SWD Lab contacted Frank Grey of Fort Worth District to verify the tests. Also, one cooler did not have any ice. The Quality Assurance sample was contracted out to a Corps of Engineers' validated laboratory, Eureka. The BTEX and TCLP/BTEX analyses were performed at a Corps of Engineers' validated laboratory, NDRC. All other analyses were performed at SWD Laboratory.

The data package from Eureka Laboratories, Inc. was received complete with all required internal quality control and quality assurance information. All analyses were performed using specified methods within proper holding times. All method blanks appear to have been free of contamination. All surrogate, duplicate, blank spike, and matrix spike recoveries were within control limits.

The data package from NDRC Laboratories, Inc. was received complete with all required internal quality control and quality assurance information. EXECUTIVE SUMMARY

On February 24-26 and March 1, 1993, **TARGET Environmental Services, Inc.** (**TARGET**) conducted a soil gas survey at **Site ST-16, Base Service Station, Carswell Air Force Base, Texas**, where petroleum hydrocarbons have impacted the ground water. A total of 86 soil gas samples were collected from depths of 4 to 9 feet. The samples were analyzed on a gas chromatograph equipped with a flame ionization detector (**GC/FID**) for petroleum hydrocarbons. The objective of the survey was to help determine the areal extent of the contaminated ground water plume emanating from the Base Service Station.

High levels of Total FID Volatiles were present along the sewer line east of Rogner Drive. Moderate levels occurred along the western side of Rogner Drive and in a sample collected south of the sewer line. All of these samples were collected from a depth of 4 feet. Low levels were observed in three isolated areas along the eastern and southern survey boundaries. Significant levels of volatile hydrocarbons were not present at a depth of 9 feet throughout the grassy area in the central portion of the survey area.

The chromatogram signatures of the samples collected on the western side of Rogner Drive are characteristic of **relatively unweathered gasoline**. Early eluting peaks representing the most volatile and mobile gasoline hydrocarbons are observed in the signatures of the samples collected along the sewer line.

Soil gas data support the introduction of gasoline hydrocarbons into the subsurface at the base service station. Chromatographic data suggests that the sewer line may be providing a conduit for vapor migration in this area. The low levels of gasoline hydrocarbons observed along the eastern survey boundary may be the result of revolatilization of hydrocarbons dissolved in the ground water, suggesting that the ground water plume may extend this far. The connection between the source at the base service station and the low levels at the eastern site boundary were

not determined by this survey. Vertical vapor migration may have been impeded in the central portion of the survey area by the clay/silt soils.

Introduction

The U.S. Army Corps of Engineers, Fort Worth District contracted Target Environmental Services, Inc. (TARGET) to conduct a soil gas survey at Site ST-16, Base Service Station, Carswell Air Force Base, Texas. Petroleum products have entered the subsurface at the service station and have impacted the shallow water table aquifer in the vicinity of the station. The purpose of the soil gas survey is to help determine the areal extent of the contaminated ground water plume emanating from the Base Service Station.

The survey was designed to cover the area to the east of the existing service station with a grid spacing of approximately 50 feet between samples. Ground water was determined to be at 10.5 feet below grade in the monitoring wells and soil gas sampling was planned for a depth of 9 feet. The site is bordered on the east by the West Fork of the Trinity River. Additional site information was not provided. The field phase of the soil gas survey was conducted on February 24-26 and March 1, 1993.

Sample Collection and Analysis

Soil gas samples were collected at a total of 86 locations at the site, as shown in Figure 1. The planned sampling depth of 9 feet had to be modified following heavy rains on February 24 and 25. Soft ground and saturated soils then hampered vehicle access to some sampling locations, which were sampled using manual equipment at a depth of 4 feet. Sampling depths are reported in Table 1. Shallow ground water prevented the collection of a sample at location 73. All samples were screened in the field using a Microtip photoionization detector. A detailed explanation of the sampling procedure is provided in Appendix A.

All of the samples collected during the field phase of the survey were analyzed according to EPA Method 602 (modified) on a gas chromatograph equipped with a flame ionization detector (GC/FID), and using direct injection. Analytes selected for standardization were:

- benzene
- toluene
- ethylbenzene
- meta- and para- xylene
- ortho- xylene

These compounds were chosen because of their utility in evaluating the presence of petroleum products such as fuels, lubricating oils, and non-halogenated solvents. An explanation of the laboratory procedures is provided in Appendix B.

The tabulated results of the laboratory analysis of the soil gas samples are reported in micrograms per liter ($\mu\text{g/l}$) in Table 1. Although "micrograms per liter" is equivalent to "parts per billion (v/v)" in water analyses, they are not equivalent in gas analyses, due to the difference in the mass of equal volumes of water and gas matrices. The xylenes concentrations reported in the data table are the sum of the m- and p-xylene and the o-xylene concentrations for each sample.

Quality Assurance/Quality Control (QA/QC) Evaluation

Field QA/QC Samples

Field control samples were collected at the beginning and end of each day's field activities and after every twentieth soil gas sample. These QA/QC samples were obtained by filtering ambient air through a dust and organic vapor filter cartridge and encapsulating as described in the "Field Procedures" in Appendix A. The laboratory results are reported in Table 1. Concentrations of all analytes were below the reporting limit in all field control samples,

indicating that the QA/QC measures employed were sufficient to prevent cross-contamination of the samples during collection.

Laboratory QA/QC Samples

To document analytical repeatability, a duplicate analysis was performed on every tenth field sample. Laboratory blanks of nitrogen gas were also analyzed after every tenth field sample. The results of these analyses are reported in Table 1. The duplicate analyses were within acceptable limits. Concentrations of all analytes were below the reporting limit in all laboratory blanks.

Results

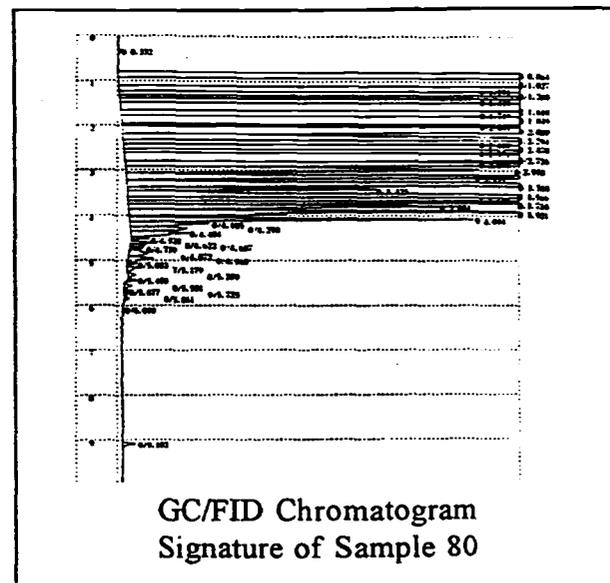

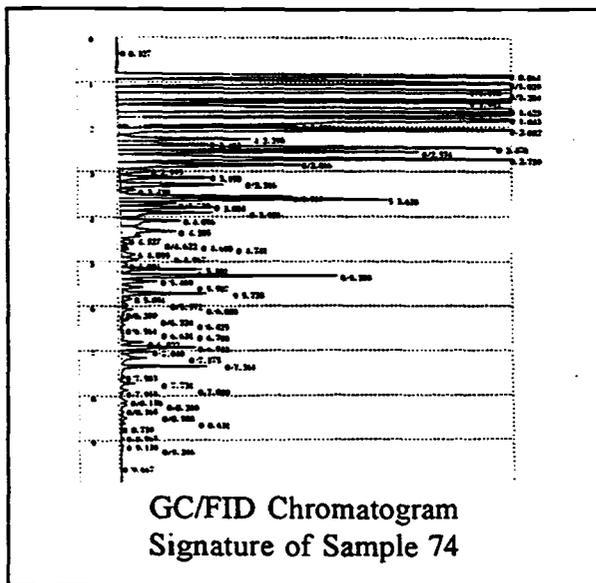

In order to provide graphic presentation of the results, selected individual data sets in Table 1 have been mapped and contoured to produce Figures 2 through 5. Dashed contours are used where patterns are extrapolated into areas of less complete data, or as auxiliary contours. Map sample points with no data shown indicate that the analyte concentrations in the sample were below the reporting limit. An explanation of the terminology used in this report is provided in Appendix C.

The Total FID Volatiles map (Figure 2) reveals high levels along the sewer line east of Rogner Drive. The highest level is present in Sample 80. Moderate levels occur along the western side of Rogner Drive and in Sample 76, collected south of the sewer line. All of these samples were collected from a depth of 4 feet. Low levels are observed in three isolated areas along the northeastern, southeastern and southern survey boundaries. Significant levels of volatile hydrocarbons were not present at a depth of 9 feet throughout the grassy area in the central

portion of the survey area. Volatile hydrocarbons were not present at a depth of 7 feet along the western boundary of the survey area.

Except for a low level of benzene in Sample 91, collected along the northeastern survey boundary, benzene was present only in samples collected along the sewer line and on the western side of Rogner Drive, as shown in Figure 3. The toluene occurrence is mapped in Figure 4. Both benzene and toluene were highest in Sample 80, which had the highest level of Total FID Volatiles. In contrast, ethylbenzene and xylenes were highest in Sample 74, collected on the western side of Rogner Drive, as exemplified by the xylenes map (Figure 5).

Interpretation

Significant levels of petroleum hydrocarbons are present along the sewer line east of Rogner Drive and along the western side of Rogner Drive. The chromatogram signatures of the samples collected on the western side of Rogner Drive are characteristic of **relatively unweathered gasoline**, as exemplified by the signature of Sample 74 (above left). The xylenes are less

volatile and less soluble than the other analytes, adsorb more readily to the soil particles, and tend to remain nearer to the source. As a result, the xylenes are usually good indicators of source locations. The xylene map patterns are consistent with the expected source at the base service station. Early eluting peaks representing the most volatile and mobile gasoline hydrocarbons are observed in the signatures of the samples collected along the sewer line, as shown by the signature of Sample 80 (previous page, right). This pattern is suggestive of vapor phase migration. It appears that the sewer line may be providing a conduit for migration in this area. Low levels of gasoline hydrocarbons are depicted in the signatures of samples from the eastern survey boundary. The pattern seen in these signatures is sometimes observed when the source of the hydrocarbons is revolatilization of hydrocarbons dissolved in the ground water.

It is interesting to note that except at location 52 from the southern boundary, volatile hydrocarbons were not present at a depth of 9 feet throughout the central portion of the survey area, but low levels did occur at a depth of 4 feet at a few locations along the eastern site boundary. The connection between the source at the base service station and the low levels at the eastern site boundary were not determined by this survey. Vertical vapor migration may have been impeded in this area by the clay/silt soils.

Conclusions

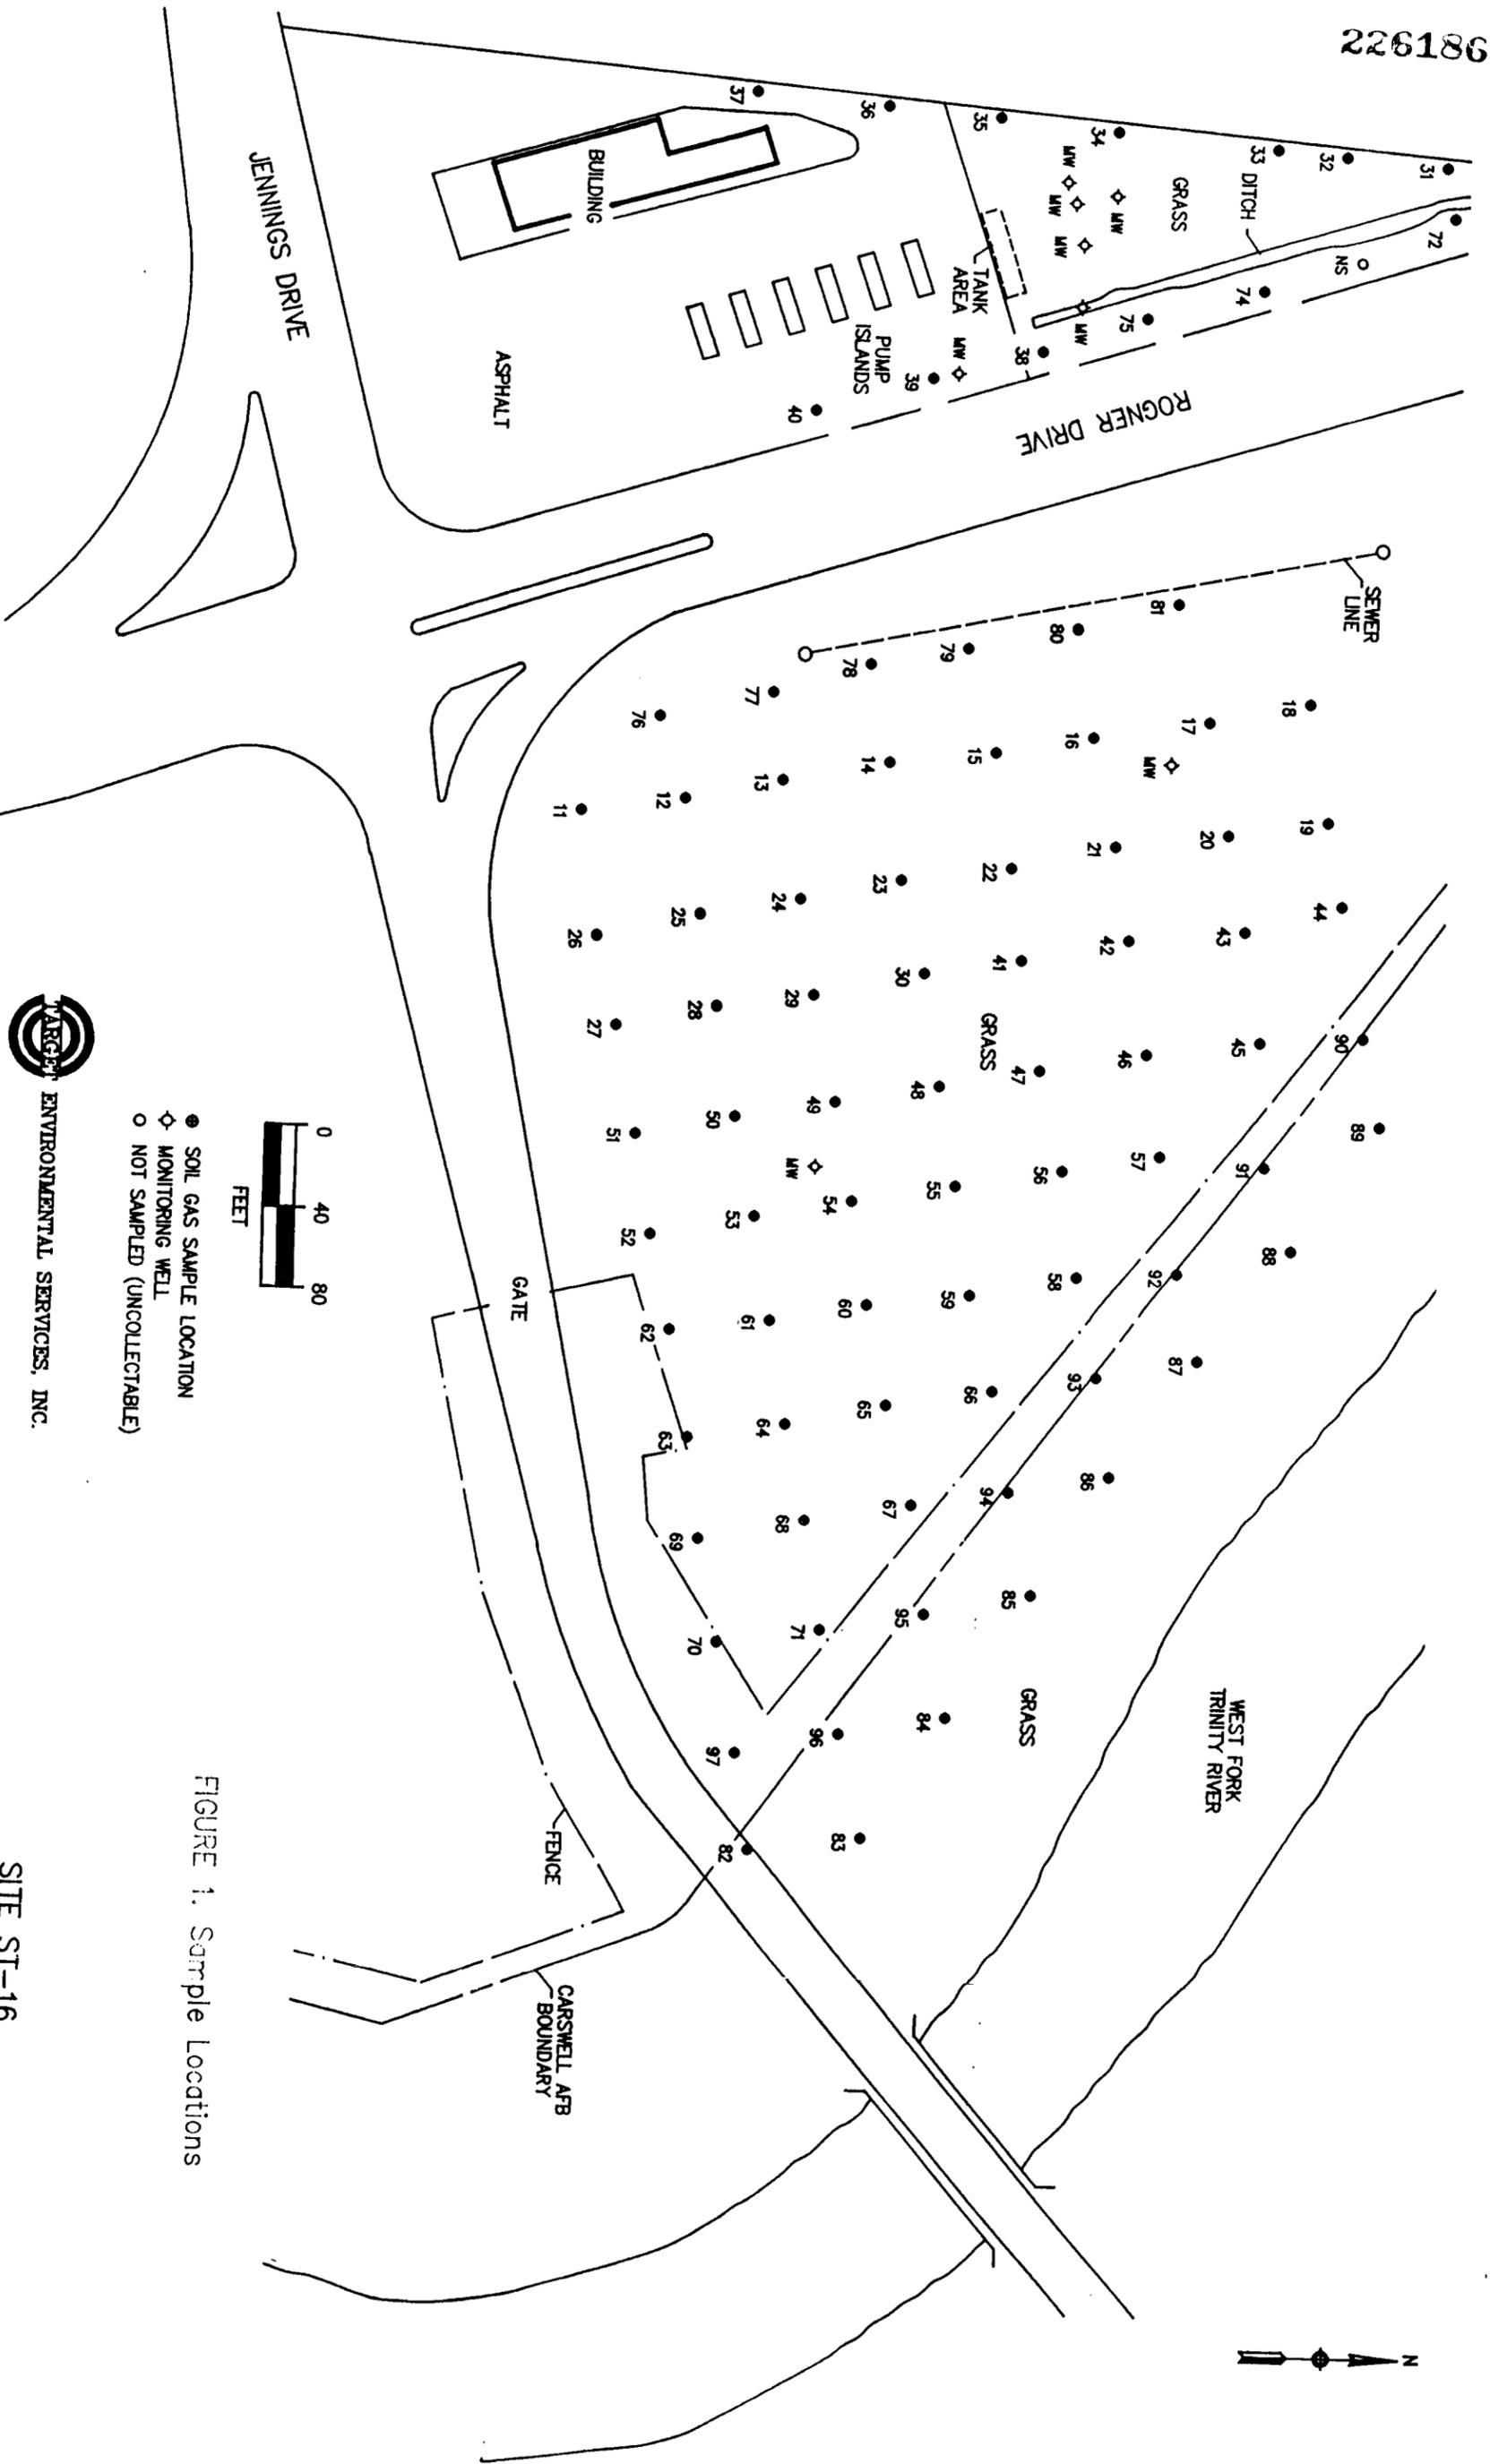

- ▶ Significant levels of petroleum hydrocarbons are present along the sewer line east of Rogner Drive and along the western side of Rogner Drive.

- ▶ The chromatogram signatures of the samples collected on the western side of Rogner Drive are characteristic of **relatively unweathered gasoline**. The xylene map patterns are consistent with the expected source at the base service station.

- ▶ Chromatographic data suggests that the volatile hydrocarbons observed along the sewer line are the result of vapor phase migration into this area.

- ▶ The low levels of gasoline hydrocarbons observed along the eastern survey boundary may be the result of revolatilization of hydrocarbons dissolved in the ground water, suggesting that the ground water plume may extend to the eastern site boundary.

- ▶ The connection between the source at the base service station and the low levels at the eastern site boundary were not determined by this survey. Vertical vapor migration may have been impeded in the central portion of the survey area by the clay/silt soils.

FIELD PROCEDURES

Two sampling procedures were employed. For both methods, the entire sampling system was first purged with ambient air drawn through an organic vapor filter cartridge. In general, deep (>4 foot) samples were collected using a van-mounted hydraulic probe to advance connected 3 foot sections of 1 inch diameter threaded steel casing down to the sampling depth. A teflon line was inserted into the casing to the bottom of the hole, and the bottom-hole line perforations were isolated from the up-hole annulus by an inflatable packer. Shallow samples (4 feet or less) were collected manually using a drive rod to produce a 1/2 inch hole. A stainless steel probe was inserted to the full depth of the hole and sealed off from the atmosphere. Where pavement was present, a rotary hammer was employed for penetration prior to using the drive rod.

Following isolation of the sampling zone, a sample of in-situ soil gas was then withdrawn through the probe or line and used to purge atmospheric air from the sampling system. A second sample of soil gas was withdrawn through the probe and encapsulated in a pre-evacuated glass vial at two atmospheres of pressure (15 psig). The self-sealing vial was detached from the sampling system, packaged, labeled, and stored for laboratory analysis.

Prior to the day's field activities all sampling equipment, slide hammer rods and probes were decontaminated by washing with soapy water and rinsing thoroughly. Internal surfaces were flushed dry using pre-purified nitrogen or filtered ambient air, and external surfaces were wiped clean using clean paper towels.

LABORATORY PROCEDURES

The analytical equipment was calibrated using a 3-point instrument-response curve and injection of known concentrations of the target analytes. Retention times of the standards were used to identify the peaks in the chromatograms of the field samples, and their response factors were used to calculate the analyte concentrations.

Total FID Volatiles values were generated by summing the areas of all integrated chromatogram peaks and calculated using the instrument response factor for toluene. Injection peaks, which also contain the light hydrocarbon methane, were excluded to avoid the skewing of Total FID Volatiles values due to injection disturbances and biogenic methane. For samples with low hydrocarbon concentrations, the calculated Total FID Volatiles concentration is occasionally lower than the sum of the individual analytes. This is because the response factor used for the Total FID Volatiles calculation is a constant, whereas the individual analyte response factors are compound specific. It is important to understand that the Total FID Volatiles levels reported are relative, not absolute, values.

DETECTABILITY & TERMINOLOGY

Detectability

The soil gas survey data presented in this report are the result of precise sampling and measurement of contaminant concentrations in the vadose zone. Analyte detection at a particular location is representative of vapor, dissolved, and/or liquid phase contamination at that location. The presence of detectable levels of target analytes in the vadose zone is dependent upon several factors, including the presence of vapor-phase hydrocarbons or dissolved or liquid concentrations adequate to facilitate volatilization into the unsaturated zone.

Terminology

In order to prevent misunderstanding of certain terms used in TARGET's reports, the following clarifications are offered:

Analyte refers to any of the hydrocarbons standardized for quantification in the chromatographic analysis.

Anomaly refers to an area where hydrocarbons were measured in excess of what would normally be considered "natural" or "background" levels.

Elevated and **significant** are used to describe concentrations of analytes which indicate the existence of a potential problem in the soil or ground water.

Feature is used in reference to a discernible pattern in the contoured data. It denotes a contour form rather than a definite or separate chemical occurrence.

Indicates is used when evidence dictates a unique conclusion. **Suggests** is used when several explanations of certain evidence are possible, but one in particular seems more likely. As a result, "indicates" carries a higher degree of confidence in a conclusion than does "suggests."

Occurrence is used to indicate an area where chemical compounds are present in sufficient concentrations to be detected by the analysis of soil vapors. The term is not indicative of any specific mode of occurrence (vapor, dissolved, etc.), and does not necessarily indicate or suggest the presence of "free product" or "phase-separated hydrocarbons."

Reporting Limit refers to the minimum concentration reported for each analyte.

Vadose zone represents the unsaturated zone between the ground water table and the ground surface.

CASE NARRATIVE

Three Quality Assurance soil samples arrived at the Southwestern Division Laboratory on 14 and 20 May 1993 from Carswell AFB - Bldg.'s 1518 and 1628. The samples arrived in good condition with complete chain of custody forms. Sample CAFB-1518-B-NW QA was contracted out to a Corps of Engineers' validated laboratory, NDRC. Samples CAFB-1628-B-BH QA and CAFB-1628-FL-C2-33' QA were contracted out to a Corps of Engineers' validated laboratory, Eureka Laboratory.

The data package from NDRC Laboratory was received complete with all required internal quality control and quality assurance information. All analysis were performed using specified methods within proper holding times. All method blanks appear to have been free of contamination. All surrogate, duplicate, blank spike and matrix spike recoveries were within control limits for the samples.

The data package from Eureka Laboratory was received complete with all required internal quality control and quality assurance information. All analysis were performed using specified methods within proper holding times. All method blanks appear to have been free of contamination. All surrogate, duplicate, blank spike and matrix spike recoveries were within control limits for the samples.

CASE NARRATIVE

Four travel blanks, eighteen soil samples, four quality control samples and four quality assurance samples arrived at Southwestern Division Laboratory on 24, 30 November and 06, 07, 09 and 14 December 1993 from Carswell AFB. The samples arrived in good condition and with complete chain of custodies except that sample 3-9296 arrived with a cracked lid. The analyses for the field and quality control samples were contracted out to a Corps of Engineers' validated laboratory, Environmental Testing and Consulting, Inc. The analyses for the quality assurance samples were contracted out to a Corps of Engineers' validated laboratory, NDRC Laboratories, Inc.

The data package from NDRC Laboratories, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods within proper holding times. All matrix spike, surrogate and laboratory control recoveries were within control limits. All method blanks were free of contamination.

The data package from Environmental Testing and Consulting, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods and within proper holding times. All duplicates, matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions.

- Surrogate recoveries for BTEX for numerous samples were outside of control limits.
- For samples 9577-9581 and 9615-9620, MSD recoveries and MS/MSD RPD values for TPH as gasoline range organics were outside of control limits. Acceptable MS recoveries were recorded.
- For samples 9753-9758, MS/MSD RPD values for benzene and toluene were outside of control limits.
- For samples 9753-9758, the MS recovery for TPH as gasoline range organics was outside of control limits. An acceptable MSD recovery was recorded.
- For samples 9753-9758 and 9800-9802, the MS/MSD recoveries for MTBE were outside of control limits. Acceptable LCS recoveries validated the data.

All method blanks were free of contamination. Corrections for several typographical errors can be found on the Quality Control Checklist.

Following is a synopsis of the quality assurance samples and their related QC and field samples: 226312

Customer Sample No.: MW-11 QC, MW-11 QA
SWD Lab Sample No.: 3-9428, 3-9429

<u>Parameter</u>	<u>Field</u>	<u>QC</u>	<u>QA</u>	<u>Units</u>	<u>Comment</u>
BTEX:					
benzene	NA	< 4.8	< 2.0	µg/Kg	Agree
toluene	NA	6.1	< 2.0	µg/Kg	Agree
ethylbenzene	NA	< 4.7	< 2.0	µg/Kg	Agree
xylenes	NA	< 5.1	< 2.0	µg/Kg	Agree
MTBE	NA	< 5.0	< 10.0	µg/Kg	Agree

Following is a synopsis of the quality assurance samples and their related QC and field samples:

| 1. Holding Times | | |
| a) BTEX/MTBE | [In] | [Out] |
| b) TRPH | [In] | [Out] |
| 2. Do detection limits and dilution factors agree? | [Y] | [N] |
| 3. Are units correct? | [Y] | [N] |

QC Check

- | | | |
|---------------------------------|-----------------------|------------------|
| 1. MS/MSD | [In] | [Out] |
| 2. RPD for MS/MSD | [In] | [Out] |
| 3. LCS and/or Blank Spike | [In] | [Out] |
| 4. Blanks | [Below DL] | [Above DL] |
| 5. Acceptable Surrogates | [Y] | [N] |
| 6. RPD for duplicates | [In] | [Out] |
| 7. Tuning and calibration check | [Y] | [N] |

Comments

For sample MW-11-FS-1 16'-18' field ID should be MW-11-FS-2 16'-18' and SWD number should be 3-9427.
For sample 3-9756, field ID should be MW-10-FS-3 (31'-32') for TPH.
For sample 3-9800, field ID should be MW-12-FS-1 (7'-8').
Sampling dates for samples 9577-9581 should be December not November.
Date received for sample 3-9753 should be December not November.
Holding time for sample 3-9580 not exceeded for TPH.
Surrogate out for BTEX for samples 9296, 9424, 9426, 9428, 9577, 9578, 9616-9619 and for method blanks (12/2-3) and for MSD (12/3).

QUALITY CONTROL CHECKLIST

226317

MS/MSD RPD for TPH for samples 9424-9429 should be 2%, not 25%.
For samples 9577-9581 and 9615-9620, MSD and MS/MSD RPD out for TPH
in gasoline range organics.
For samples 9753-9758, MS/MSD RPD out for benzene and toluene, MS
out for TPH in gasoline range organics, and MS/MSD out for MTBE.
For samples 9800-9802, MS/MSD out for MTBE.

Completed 7 DEC 1993

DIAMETER OF HOLE

Dia. (in.)	From (ft.)	To (ft.)
10	Surface	17

7) BOREHOLE COMPLETION:

- Open Hole Straight Wall Underreamed
 Gravel Packed Other SAND PACKED
If Gravel Packed give interval ... from 4 ft. to 17 ft.

From (ft.) To (ft.) Description and color of formation material

0 to 6.5' CLAY, BROWN
6.5' to 11.0' SAND/SILT, LT. GRAY
11.0' to 17.0' LIMESTONE, GRAY

8) CASING, BLANK PIPE, AND WELL SCREEN DATA:

Dia. (in.)	New or Used	Steel, Plastic, etc. Perf., Slotted, etc. Screen Mfg., if commercial	Setting (ft.)		Gage Casting Screen
			From	To	
4	N	PVC, 6.59	0.05	6.13	
4	N	PVC, SCREEN	6.13	16.13	.01

9) CEMENTING DATA [Rule 287.44(1)]

Cemented from 0.5 ft. to 2.0 ft. No. of Sacks Used .5
_____ ft. to _____ ft. No. of Sacks Used _____
Method used _____
Cemented by _____

13) TYPE PUMP:

- Turbine Jet Submersible Cylinder
 Other _____
Depth to pump bowls, cylinder, jet, etc., _____ ft.

10) SURFACE COMPLETION

- Specified Surface Slab Installed [Rule 287.44(2)(A)]
 Specified Steel Sleeve Installed [Rule 287.44(3)(A)]
 Pitless Adapter Used [Rule 287.44(3)(B)]
 Approved Alternative Procedure Used [Rule 287.71]

14) WELL TESTS:

Type Test: Pump Bailer Jetted Estimated
Yield: _____ gpm with _____ ft. drawdown after _____ hrs.

11) WATER LEVEL:

Static level 8.7' ft. below land surface Date 9 DEC. 93
Artesian flow _____ gpm. Date _____

15) WATER QUALITY:

Did you knowingly penetrate any strata which contained undesirable constituents?
 Yes No If yes, submit "REPORT OF UNDESIRABLE WATER"
Type of water? _____ Depth of strata _____
Was a chemical analysis made? Yes No

12) PACKERS:

I hereby certify that this well was drilled by me (or under my supervision) and that each and all of the statements herein are true to the best of my knowledge and belief. I understand that failure to complete items 1 thru 15 will result in the log(s) being returned for completion and resubmittal.

State of Texas Well Plugging Report
for BSS-C

Please use black ink. File WHITE COPY with: Texas Water Commission P.O. Box 13087 Austin, Texas 78711 Phone (512) 371-6299	State of Texas PLUGGING REPORT (This form must be completed and filed with the TWC within 30 days following the date the well is plugged as required by current statutory law.)	226348 Texas Water Well Drillers Board P.O. Box 13087 Austin, Texas 78711 Phone (512) 371-6299
---	--	---

A. Well Identification and Location Data

- 1) Owner AIR FORCE CONVERSION AGENCY Address FORMER CARSWELL AFB FT. WORTH TX 76131
(Name) (Street or RFD) (City) (State) (Zip)
- 2) Owner's Well Number BSS-C (BASE SERVICE STATION)
- 3) Location of Well: County TARRANT 6 miles in W direction from DOWNTOWN FT. WORTH TX
(N.E., S.W., etc.) (Town)

Driller or other person performing the plugging operations must complete the legal description to the right with distance and direction from two intersecting section or survey lines, or he must locate and identify the well on an official Quarter- or Half-Scale Texas County General Highway Map and attach the map to this form.

Legal description:

Section No. _____ Block No. _____ Township _____

Abstract No. _____ Survey Name _____

Distance and direction from two intersecting section lines or survey lines: _____

See Attached map.

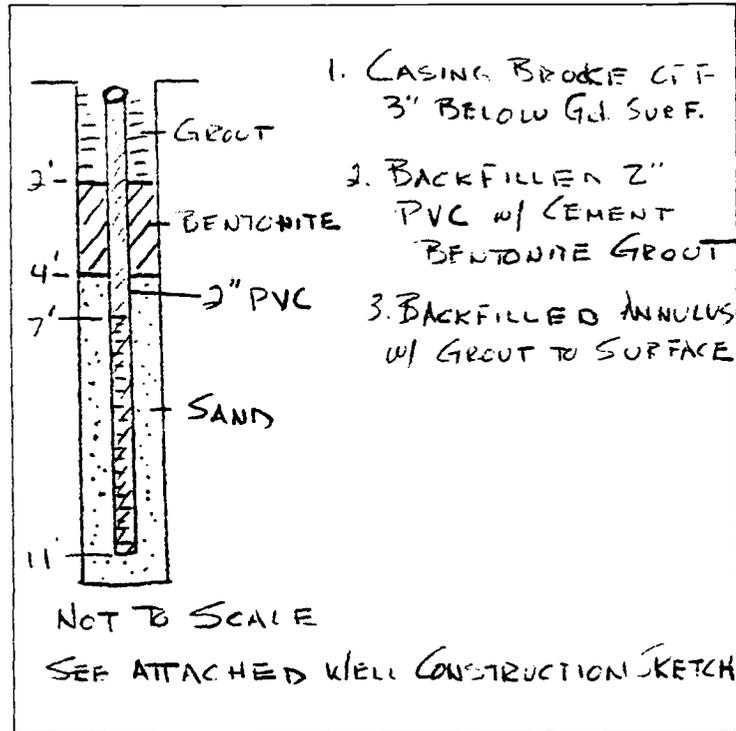

B. Historical Data on Well To Be Plugged (if available)

- 4) Driller ATEC ASSOC INC. License Number UNKNOWN City UNKNOWN
- 5) Drilled 14 FEB 1988; 6) Diameter of hole 6.6 inches; 7) Total depth of well 12 feet.

C. Current Plugging Data

- 8) Date well plugged 1 DEC 1993
- 9) Sketch of well: Using space at right, show method of plugging the well including all casing and cemented intervals.
- 10) Name of Driller or other person actually performing the plugging operations GREG WILLIAMS
 if a water well driller plugged the well, give the driller's license no. _____
- 11) Casing and cementing data relative to the plugging operations:

Diameter (inches)	Casing Left in Well	
	From (feet)	To (feet)
2	0.0	11.0
Cement Plug(s) Placed in Well		
From (feet)	To (feet)	Sack(s) of cement used
0.0	11.0	7 GAL.

D. Validation of Information Included in Form

I hereby certify that this well was plugged by me (or under my supervision) and that all of the statements herein are true and accurate to the best of my knowledge and belief.

Company or Individual's Name U.S. ARMY CORPS OF ENGINEERS (Type or Print)

NOTES CONCERNING CONDITION OF WELL, ODOR, COLOR, AND PROBLEMS

Purge Day - 1.0' - Cool - No Odor
Bring Purge Water

Sample Day - Cool
Slightly turbid water

SAMPLE COLLECTOR: J. Saw & D. Garnett

226374

WATER SAMPLES FIELD DATA FORM

PROJECT: Crowell AFB DATE: 1-6-94

SITE: Base Service Station TYPE OF SAMPLE: Water

WELL NO: MW4 LOCATION: North of Station

CSG DIAM 4" CSG TYPE: PVC

RISER ELEV. Ground Level

DEPTH TO WATER FROM TOP OF CASING: 6.65 TIME: 0925/1-6-94

RATE OF RECHARGE: TOTAL Recovery

DEPTH TO WATER AT TIME OF SAMPLING: 6.66 TIME: 1505/1-6-94

WATER TABLE: _____ MEASURING DEVICE: Sample Pro

PH: 7.44 7.44 TIME: 1500 TYPE: Hydac

PH: 7.44 7.44

CONDUCTIVITY, umhos/cm TIME: 1500 TYPE: Hydac

1034 1037

TEMPERATURE: 62.4°

1034 1037

TURBIDITY: yes

CHEST# C20 C/SEAL# 10694C20 BUS BILL# 1206981754

CHEST# C20 C/SEAL# 10694C20 BUS BILL# 1206981754

NOTES CONCERNING CONDITION OF WELL, ODOR, COLOR, AND PROBLEMS

Purge - High reading when first opened
well on LEL - after letting it set, cleared
cut. Dirty water then black. Strong odor

Sample Day - cool - Windy
Odor = turbid

No Gasoline on Paste

SAMPLE COLLECTOR: J. Howard & D. Barnett

WATER SAMPLES FIELD DATA FORM

226375

PROJECT: Candwell AFB DATE: 1-5-94

SITE: Base Service Station TYPE OF SAMPLE: Water

WELL NO: BSS-B LOCATION: North of Service Station

CSG DIAM: 2" CSG TYPE: PVC

RISER ELEV. 32" W.C. 35 P.C.

DEPTH TO WATER FROM TOP OF CASING: 9.81 TIME: 0920 | 1. 94

RATE OF RECHARGE: TOTAL Recharge

DEPTH TO WATER AT TIME OF SAMPLING: 9.82 TIME: 1435 | 1. 9-

WATER TABLE: _____ MEASURING DEVICE: Sample Pro

PH: 7.66 7.67 TIME: 1430 TYPE: Hydac

PH: 7.62 7.63

CONDUCTIVITY, umhos/cm TIME: 1430 TYPE: Hydac

1048 1049

TEMPERATURE: 59.8°

1048 1049

TURBIDITY: Very Black

COOLER RECEIPT FORM

226515

Date Received 04 JAN 94 Project CARSWELL BASE SERVICE STATION

Number of Coolers 4 District FT WORTH

Date Checked in 04 JAN 94 By (sign) Randy Smith

1. Shipping bill number GH 120 698 163 3 ; 164 4

2. Custody seals on cooler 1 FRONT AND 1 BACK EACH

3. Custody seals intact.....YES NO

4. Chain-of-Custody in plastic.....YES NO

5. Chain-of-Custody filled out properly.....YES NO

6. SWD signed Chain-of-Custody properly.....YES NO

7. Ice and Packing _____

8. All bottles sealed.....YES NO

9. Any bottles broken.....YES NO

10. Labels in good condition and complete.....YES NO

11. Labels agree with COC.....YES NO

12. Correct containers used.....YES NO

13. Preserved properly.....YES NO

14. Sufficient sample.....YES NO

15. Bubbles absent from VOA.....YES NO

16. Temperature of cooler at receipt 2.4°C

17. Client called.....YES NO

Details: _____

18. Comments: COC INDICATES ALL SX'S TO BE TESTED FOR VO, BUT LABELS AND LETTER DATED 3 JAN 94 INDICATE MTBE ON ALL SX'S & BTEX/MTBE ON SOME. COC'S FOR SX'S TO TEST BTEX/MTBE HAVE 2 VIALS EA, BUT SWD REC'D 3 VIALS EA. COC'S FOR ALL SX'S INDICATE 1L AMBER GLASS PER TRPH SX, BUT SWD REC'D 2 EACH /SA

CASE NARRATIVE

Sixteen water samples, four travel blanks, two quality control samples and two quality assurance samples arrived at Southwestern Division Laboratory on 04-07 January 1994 from Carswell AFB - Base Service Station. The samples arrived in good condition but the chain of custodies did not agree with the labels concerning tests requested and number of samples sent per test. The analyses for the field samples were contracted out to a Corps of Engineers' validated laboratory, NDRC Laboratories, Inc. The analyses for the quality assurance samples, excluding the analyses for PAH, were contracted out to a Corps of Engineers' validated laboratory, Environmental Testing and Consulting, Inc. The analyses for PAH for the quality assurance samples were contracted out to a Corps of Engineers' validated laboratory, Southwest Research Institute.

The data package from NDRC Laboratories, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods within proper holding times. All matrix spike, surrogate and laboratory control recoveries were within control limits. All method blanks were free of contamination.

The data package from Environmental Testing and Consulting, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods and within proper holding times. All duplicates, matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions.

- The MSD recovery and the MS/MSD RPD value for lead for both samples were outside of control limits. Acceptable MS and LCS were recorded.
- The continuing calibration for most volatile organic analytes for both samples were outside of control limits.
- The MS/MSD recoveries for TRPH for sample 4-0013 were outside of control limits due to high analyte concentration. The LCS/LCSD recoveries were acceptable.

All method blanks were free of contamination.

The data package from Southwest Research Institute was received complete with all required internal quality control information. All analyses were performed using specified methods and within proper holding times. All matrix spike and surrogate recoveries were within control limits. All method blanks were free of contamination.

226546

Following is a synopsis of the quality assurance samples and their related QC and field samples:

Customer Sample No.: MW-10, QC-A, QA-A
 SWD Lab Sample No.: 4-0003, 4-0006, 4-0007

Parameter	Field	QC	QA	Units	Comment
Lead	19	28	37	µg/L	Agree
TDS	847	843	1035	mg/L	Agree
TRPH	9.8	9.4	20.7	mg/L	Agree
VOA/MTBE					
Benzene	5260	5480	4480	µg/L	Agree
Toluene	21600	21800	21400	µg/L	Agree
Ethyl benzene	4850	4790	4100	µg/L	Agree
Xylene	13900	14000	13100	µg/L	Agree
MTBE	6090	6790	6540	µg/L	Agree
TICs	3 TICs	3 TICs	10 TICs		
PAH:					
Acenaphthylene	300	66	< 23	µg/L	Disag*
Naphthalene	704	144	890	µg/L	Disag*

* Data was rechecked and found acceptable.

Following is a synopsis of the quality assurance samples and their related QC and field samples: 226547

Customer Sample No.: MW-1, QC-B, QA-B
 SWD Lab Sample No.: 4-0010, 4-0012, 4-0013

Parameter	Field	QC	QA	Units	Comment
Lead	16	16	15	µg/L	Agree
TRPH	8.0	9.0	17.1	mg/L	Agree
VOA/MTBE					
Benzene	1010	1020	1320	µg/L	Agree
Toluene	2650	2500	3010	µg/L	Agree
Ethyl benzene	4610	4450	5500	µg/L	Agree
Xylene	9610	9210	11700	µg/L	Agree
MTBE	270	277	<500	µg/L	Agree
TICs	11 TICs	11 TICs	10 TICs		
PAH:					
Acenaphthylene	355	360	< 23	µg/L	Disag*
Naphthalene	700	713	710	µg/L	Agree

* Data was rechecked and found acceptable.

PROJECT: Carswell AFB

Data check time: 6 hr
226548

SAMPLES: 0001-0007, 0009-0013, 0017-0023, 0032-0036

REPORT DATE: 31 January 1994

QUALITY CONTROL CHECKLIST

Chain of Custody Check

1. Do sample ID numbers agree with the C.O.C? [Y] [N]
2. Do site and location agree with the C.O.C? [Y] [N]
3. Do sampling dates agree with the C.O.C? [Y] [N]
4. Do method numbers agree with the C.O.C? [Y] [N]
5. Are all samples and analyses accounted for? [Y] [N]

Data Check

1. Holding Times
 - a) BTEX/MTBE [In] [Out]
 - b) TRPH [In] [Out]
 - c) TDS [In] [Out]
 - d) Lead [In] [Out]
 - e) Volatiles [In] [Out]
 - f) PAH [In] [Out]
2. Do detection limits and dilution factors agree? [Y] [N]
3. Are units correct? [Y] [N]

QC Check

1. MS/MSD [In] [Out]
2. RPD for MS/MSD [In] [Out]
3. LCS and/or Blank Spike [In] [Out]
4. Blanks [Below DL] [Above DL]
5. Acceptable Surrogates [Y] [N]
6. RPD for duplicates [In] [Out]
7. Tuning and calibration check [Y] [N]

Comments

For QA samples, MS and MS/MSD RPD out for Pb and continuing calibration out for most VOA analytes.

For QA sample 4-0013, MS/MSD out for TRPH due to high analyte concentration. LCS/LCSD are good.

Methylene chloride (7.3 µg/L) detected in trip blanks (4-0001 and 4-0032).

TAB

**Soil Sampling and Surface Water Sampling
Field Data Sheets**

226551

SOIL/SEDIMENT SAMPLING

FIELD DATA SHEET

Location Base Service Date 20 Sept 93

Site West Bank of W. Fork Trinity River Sample No. SED-1A

Weather Conditions Sunny, dry, cool

Stream Conditions Low, still

Depth of stream N/A

Sampling Depth 1.0' Start/End Times 0900 - 0910

Sample Containers Collected:

QA/QC Samples Collected:

VOC	<u>2</u>	<u>N/A</u>
TRPH & Pb	<u>1</u>	<u> </u>
PAH	<u>1</u>	<u> </u>

Rinsate Sample to be analyzed for N/A

Cooler No. C-115

Remarks/Comments River about 8' below SED-1 sampling pt.

Location immediately above water surface of river, approx 10'
S of SED-1 location. Clayey sand, v. moist, gray to black
w/depth, strong gasoline odor. Contamination appears
to extend 2' above water surface. No sheen on water.

No other areas found w/ odor along river. 3 days after rain (9/25)

Sampler's Signature Deborah Fitzgerald

226552

SURFACE WATER SAMPLING

FIELD DATA SHEET

Location Carswell B.S.S. Date 10-22-93

Site South end of Culvert Sample No. SW-2A

Weather Conditions Clear, Sunny, Cool - 60°

Stream Conditions strong, hydrocarbon odor, water ~~clear~~ murky, tan in color, very slow flow

Depth of stream 1 ft.

Sampling Depth Surface Start/End Times 0930 - 0940

CASE NARRATIVE

One soil sample arrived at Southwestern Division Laboratory on 28 September 1993 from Carswell Air Force Base. The sample arrived in good condition and with a complete chain of custody. On 28 September 1993, the Technical Manager, Ms. Deborah Fitzgerald, was contacted to discuss the VOC method. As a result of the discussions, the VOC method was changed from Method 8020 to Method 8240. The sample was contracted out to a Corps of Engineers' validated laboratory, NDRC Laboratories, Inc.

The data package from NDRC Laboratories, Inc. was received complete with all required internal quality control information. For the PAH analysis, the sample was run on 6 October 1993, but the internal quality control reports were from 17 September 1993. All analyses were performed using specified methods within proper holding times. All matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions. The MS/MSD recoveries for lead were outside control limits due to matrix interference. Both the RPD for the duplicate and the MS/MSD recoveries were outside control limits for lead. The MS/MSD recoveries for acenaphthene and acenaphthylene, both PAH compounds, were out of control limits. The MSD recovery for fluorene, a PAH compound, was out of control limits. The laboratory control sample for the PAH analysis was out of control limits for acenaphthylene, acenaphthene, and anthracene. SWD Laboratory has discussed remedying the problem of laboratory control standards failures with NDRC in order to avoid future problems. All method blanks appeared free of contamination.

PROJECT: Carswell AFB

Data check time: 1 hr
226575

SAMPLES: 3-5919

REPORT DATE: 22 Oct. 93

QUALITY CONTROL CHECKLIST

Chain of Custody Check

1. Do sample ID numbers agree with the C.O.C? [Y]
2. Do site and location agree with the C.O.C? [Y]
3. Do sampling dates agree with the C.O.C? [Y]
4. Do method numbers agree with the C.O.C? [Y]
5. Are all samples and analyses accounted for? [Y]

Data Check

1. Holding Times
 - a) Volatile Organics 14 days [In]
 - b) Petroleum Hydrocarbons 28 days [In]
 - c) Lead 6 months [In]
 - d) Hydrocarbons [In] *
2. Do detection limits and dilution factors agree? [Y]
3. Are units correct? [Y]

QC Check

1. MS/MSD [Out]
2. RPD for MS/MSD [Out]
3. LCS and/or Blank Spike [Out]
4. Blanks [Below DL]
5. Acceptable Surrogates [Y] [N] N/A
6. RPD for duplicates [Out]
7. Tuning and calibration check [Y] [N] N/A

Comments

* Date sampled is 28 Sept. Date analyzed is 17 Sept.-- NDRC used a batch from the previously sent samples.

MS%: Lead at 65.3%, Acenaphthylene at 72.8%, Acenaphthene at 52.9%.

RPD for Duplicates: Lead at 16.7%.

RPD for MS/MSD: Lead at 26.7%.

MSD%: Acenaphthylene at 67.8%, Acenaphthene at 50.8%, Fluorene at 79.2%.

LCS%: Acenaphthylene at 70.8%, Acenaphthene at 47.1%, Anthracene at 87.0%.

PAH - run on Oct 6, 1993, QC package from Sept 17.

CASE NARRATIVE

Three soil samples, four water samples, one travel blank, one rinsate blank, one soil quality control sample, one soil quality assurance sample, one water quality control sample and one water quality assurance sample arrived at Southwestern Division Laboratory on 25 October 1993 from Carswell AFB. The samples arrived in good condition and with complete chain of custodies. The analyses for the field samples, trip blanks, quality control samples and rinsate blanks were contracted out to a Corps of Engineers' validated laboratory, NDRC Laboratories, Inc. The polynuclear aromatic hydrocarbons (PAH) analyses for the quality assurance samples were contracted out to a Corps of Engineers' validated laboratory, Southwest Research Institute. All other analyses for the quality assurance samples were contracted out to a Corps of Engineers' validated laboratory, Environmental Testing and Consulting, Inc.

The data package from NDRC Laboratories, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods within proper holding times. All matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions.

- For samples 6701-6704, the MS/MSD recoveries for lead were outside of control limits due to the high concentration of the analyte. Acceptable LCS recoveries validated the data.

The method blanks were all free of contamination.

The data package from Environmental Testing and Consulting, Inc. was received complete with all required internal quality control information. All analyses were performed using specified methods and within proper holding times. The volatile organic analysis for sample 3-6705 was rerun to double check the concentration of methylene chloride. The concentration was determined to be less than the detection limit. All duplicates, matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions.

- For sample 3-6705, the MS/MSD recoveries for lead were outside of control limits due to matrix interference. An acceptable LCS recovery validated the data.
- No MSD was run for for TPH due to insufficient amount of sample for sample 3-6713. Acceptable MS and LCS recoveries validated the data.
- For sample 3-6705, MS was outside of control limits for VOA for methyl ethyl ketone, tetrachloroethene and 1,4-chloroethyl vinyl ether. Acceptable LCS recoveries validated the data.

226688

- For sample 3-6713, MS was outside of control limits for VOA for 2-chloroethyl vinyl ether, methylene chloride and 1,1,2,2-tetrachloroethane. Acceptable LCS recoveries validated the data.

All method blanks were free of contamination.

The data package from Southwest Research Institute was received complete with all required internal quality control information. All analyses were performed using specified methods and within proper holding times. All duplicates, matrix spike, surrogate and laboratory control recoveries were within control limits with the following exceptions.

- MS/MSD outside of control limits for anthracene, chrysene, naphthalene, acenaphthene and benzo(a)pyrene for PAH for sample 3-6705.
- For sample 3-6713, there was insufficient sample for a matrix spike/matrix spike duplicate so a blank spike/blank spike duplicate was performed instead.
- The blank spike was outside of control limits for anthracene for sample 3-6713. An acceptable LCS recovery validated the data.

All method blanks appear to have been free of contamination.

228689

Following is a synopsis of the quality assurance samples and their related QC and field samples:

Customer Sample No.: SED-2A, SED-2A QC, SED-2A QA
 SWD Lab Sample No.: 3-6703, 3-6704, 3-6705

Parameter	Field	QC	QA	Units	Comment
Lead	52	55	55.3	mg/Kg	Agree
VOA	No Hits 12 TICs	No Hits 10 TICs	No Hits 10 TICs	µg/Kg	Agree
PAH:					
anthracene	629	<442	400	µg/Kg	Agree
benzo(a)anthracene	2040	769	410	µg/Kg	Agree
benzo(b)fluoranthene	1450	< 12.1	354	µg/Kg	Disag
benzo(g,h,i)-perylene	1540	653	505	µg/Kg	Agree
benzo(a)pyrene	1580	602	460	µg/Kg	Agree
chrysene	2040	789	1147	µg/Kg	Agree
fluoranthene	6240	2090	2450	µg/Kg	Agree
indeno(1,2,3-cd)-pyrene	665	240	390	µg/Kg	Agree
naphthalene	3910	1360	<165205	µg/Kg	Agree
phenanthrene	1780	530	1030	µg/Kg	Agree
pyrene	3670	1400	<24781	µg/Kg	Agree
dibenzo(a,h)-anthracene	< 20.1	< 20.1	128	µg/Kg	Disag
acenaphthylene	<1540	<1540	670	µg/Kg	Agree
TRPH	110	210	30	mg/Kg	Disag

226600

Following is a synopsis of the quality assurance samples and their related QC and field samples:

Customer Sample No.: SW-2A, SW-2A QC, SW-2A QA
 SWD Lab Sample No.: 3-6711, 3-6712, 3-6713

Parameter	Field	QC	QA	Units	Comment
Lead	0.002	0.003	< 0.001	mg/L	Agree
VOA:					
toluene	112	95.8	82	µg/L	Agree
ethylbenzene	10.7	7.0	6	µg/L	Agree
xylenes	103	88.3	103	µg/L	Agree
benzene	< 5.0	< 5.0	73	µg/L	Disag
	11 TICS	11 TICS	10 TICS		
PAH	No Hits	No Hits	No Hits	µg/L	Agree
TRPH	< 0.5	< 0.5	1.0	mg/L	Agree

PROJECT: Carswell AFB

Data check time: 5 hr

SAMPLES: 6701-6713

REPORT DATE: 22 November 1993

QUALITY CONTROL CHECKLIST

Chain of Custody Check

- | | | |
|--|-------------------------------------|-----|
| 1. Do sample ID numbers agree with the C.O.C? | <input checked="" type="checkbox"/> | [N] |
| 2. Do site and location agree with the C.O.C? | <input checked="" type="checkbox"/> | [N] |
| 3. Do sampling dates agree with the C.O.C? | <input checked="" type="checkbox"/> | [N] |
| 4. Do method numbers agree with the C.O.C? | <input checked="" type="checkbox"/> | [N] |
| 5. Are all samples and analyses accounted for? | <input checked="" type="checkbox"/> | [N] |

Data Check

- | | | |
|--|-------------------------------------|--------------------------|
| 1. Holding Times | | |
| a) TRPH | <input type="checkbox"/> | <input type="checkbox"/> |
| b) BTEX/MTBE | <input type="checkbox"/> | <input type="checkbox"/> |
| c) PAH | <input type="checkbox"/> | <input type="checkbox"/> |
| d) Lead | <input type="checkbox"/> | <input type="checkbox"/> |
| e) VOA | <input type="checkbox"/> | <input type="checkbox"/> |
| 2. Do detection limits and dilution factors agree? | <input checked="" type="checkbox"/> | [N] |
| 3. Are units correct? | <input checked="" type="checkbox"/> | [N] |

QC Check

- | | | |
|---------------------------------|-------------------------------------|-------------------------------------|
| 1. MS/MSD | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| 2. RPD for MS/MSD | <input type="checkbox"/> | <input type="checkbox"/> |
| 3. LCS and/or Blank Spike | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| 4. Blanks | <input type="checkbox"/> | <input type="checkbox"/> |
| 5. Acceptable Surrogates | <input checked="" type="checkbox"/> | [N] |
| 6. RPD for duplicates | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| 7. Tuning and calibration check | <input checked="" type="checkbox"/> | [N] |

Comments

MS/MSD out for Pb (6701-04) due to high concentration of analyte.
MS/MSD out for anthracene, chrysene, naphthalene, acenaphthene and benzo(a)pyrene for PAH in soil (6705).

QUALITY CONTROL CHECKLIST CONTINUED

226692

Blank spike out for anthracene for PAH for water (3-6713).
There was insufficient sample for MS/MSD for PAH for water so a
blank spike/blank spike duplicate was performed (3-6713).

MS/MSD out for Pb (3-6705).

VOA for 3-6705 was rerun to check abnormally high methylene
chloride concentration. Determined that the high concentration was
an anomaly and that the true methylene chloride concentration was
less than the detection limit.

No MSD was run for TPH due to insufficient sample (3-6713).

MS was out for VOA in soil for methyl ethyl ketone,
tetrachloroethene and 1,4-chloroethyl vinyl ether (3-6705).

MS was out for VOA in water for methylene chloride, 2-chloroethyl
vinyl ether and 1,1,2,2-tetrachloroethane (3-6713).
