UST	underground storage tank

1. INTRODUCTION

Solutions To Environmental Problems, Inc. (STEP) under a contract task order with the U.S. Department of the Navy has performed a remedial action at Solid Waste Management Unit (SWMU) 15, Naval Support Activity Mid-South (NSAM), Millington, Tennessee. The remedial action included the additional excavation, transportation, and disposal of 2,480 tons of petroleum-contaminated soil; confirmatory soil sampling; backfilling and compacting; and site restoration. All work was accomplished for the Southern Division, Naval Facilities Engineering Command.

2. PURPOSE OF THIS REPORT

This project report is designed to describe activities conducted during the remedial action, present analyses of the confirmatory soil sampling, and present recommendations for future action. The remedial action was performed in compliance with applicable regulatory mandates pertaining to the environment, worker protection, and public health.

3. SITE BACKGROUND

3.1 SITE HISTORY

The NSAM site was originally established in 1917 as "Park Field" serving as a training center for pilots. After serving multiple purposes throughout the 1920s and 1930s, during which the site also served as a transient camp for unemployed workers, the site was re-commissioned for aviation purposes in 1942. Following the end of World War II, the site served as a Naval Air Station and in a support and logistics role for almost 50 years. In 1993, the site was given its current name and the Base Realignment and Closure Commission modified the base's primary mission to operational and logistical support while also transferring partial ownership to the Millington Industrial Development Board (MIDB).

As depicted on the location map shown in Figure 3-1, NSAM Millington is located approximately 18 miles north-northeast of Memphis, Tennessee.

3.2 SITE-SPECIFIC DESCRIPTION

SWMU 15 is a former fuel farm encompassing approximately 40,000 square feet. The site consisted of 10 underground storage tanks (USTs) with capacities ranging from 10,000 to 25,000 gallons and their associated piping. The USTs were used to supply aviation fuel and lubricating oils to the nearby flight line and a truck loading station east of the SWMU. The 10 USTs were abandoned in 1986 and removed in 1991 and 1992 under the Navy's UST program. The excavations were sampled and the contaminated soils were left in place. A site map is shown in Figure 3-2.

3.3 PREVIOUS INVESTIGATIONS

Several investigations and sampling events have been conducted at the site. Extensive sampling was conducted in 1991 and 1992 during the UST removal and closure activities. In addition, a Resource Conservation and Recovery Act Facility Investigation was conducted by EnSafe, Inc. (EnSafe) in 1999. These assessments revealed benzene and total petroleum hydrocarbon (TPH) concentrations above the appropriate site-specific cleanup levels of 100 milligrams per kilogram (mg/kg) for benzene and 500 mg/kg for TPH.

In 2003, STEP excavated and disposed of 57,168 tons of petroleum-contaminated soil from SWMU 15. The volume of contaminated soil removed during this remediation phase exceeded the estimated volume of 30,000 tons in the scope of work. Although the Tennessee Department of Environment and Conservation's (TDEC) soil cleanup level was 1,000 mg/kg for TPH, the established site-specific cleanup levels of 100 mg/kg for benzene and 500 mg/kg for TPH were used for groundwater contamination. Due to budget constraints and unfavorable weather conditions, STEP was directed to backfill the excavation knowing that some contaminated soil remained on the sidewalls of the excavation. The work performed during this initial remediation is described in *Final Project Report for Soil Remediation at Solid Waste Management Unit 15, Naval Support Activity Midsouth, Millington, Tennessee* (STEP, August 2003).

Figure 3-2 Site Map

R:\114114-115-001\graphics\millington SWMU 15 2005.dwg(1-1)(11/30/05)

After the initial soil excavation, EnSafe collected samples in the areas where contamination remained. A small area of petroleum-contaminated soil to the southwest of the original excavation was identified and delineated by EnSafe. Results from EnSafe's study are detailed in *Technical Memo - Additional Excavation Delineation, Former N-94 Underground Tank Farm – SWMU 15, NSA Mid-South*, (EnSafe, April 8, 2005). EnSafe recommended excavating 3,300 cubic yards of petroleum-contaminated soil from the proposed excavation as shown in Figure 3-3.

4. REMEDIATION OBJECTIVE/CLEANUP CRITERIA

As established in the project letter work plan, the objectives of this remediation performed by STEP were as follows:

- excavate, transport, and dispose of the 3,300 cubic yards (3,000 tons) of petroleum-contaminated soil from SWMU 15,
- perform confirmatory soil sampling in the excavation to determine the effectiveness of the removal action, and
- backfill the excavation with material from the on-site borrow pit and compact to 90% (Standard Proctor), and
- restore the site.

For the purposes of this remediation, the established site-specific cleanup levels were 100 mg/kg for benzene and 1,000 mg/kg for TPH [extractable petroleum hydrocarbons (EPH) plus gasoline range organics (GRO)].

Notes:

- 1.) Topographic information developed and provided by Allen and Hoshall, Inc. of Memphis Tennessee, October 28, 2005.
- 2.) Proposed Excavation Boundary was determined by previous investigations conducted by Ensafe (Ensafe, April 2005. Technical Memo-Additional Excavation Delineation, Former N-94 Underground Tank Farm - SWMU 15, NSA Mid-South).

 Millington, Tennessee

5. REGULATORY PERMITS/REQUIREMENTS

Prior to the start of fieldwork, all applicable and relevant permits were completed and approved by the appropriate state and local entities.

5.1 STORM WATER CONSTRUCTION PERMIT

A National Pollution Discharge Elimination System Storm Water Construction Permit was not required since the area of disturbance for the excavation was less than one acre.

5.2 SPECIAL WASTE APPROVAL

The petroleum-contaminated soil from the site exceeded the allowable concentrations for benzene and TPH permitted by TDEC; therefore, the material was classified as a "Special Waste." Disposal of the material in a Subtitle D permitted landfill required a special waste approval from the Tennessee Division of Solid Waste Management (TDSWM).

During the initial soil removal in 2003, additional soil contamination outside the planned excavation was encountered. The disposal of contaminated soil in excess of 35,000 tons required the approval of TDSWM. After petitioning TDSWM, the special waste approval letter was amended by TDSWM to dispose of approximately 45,000 tons of petroleum-contaminated soil. As the excavation continued to extend, removal of additional tonnage in excess of 45,000 tons was warranted and TDSWM increased the special waste limit to 65,000 tons. At the conclusion of the initial soil removal, 57,168 tons of petroleum-contaminated soil was disposed from SWMU 15. Since the special waste limit of 65,000 tons had not been exceeded, TDSWM concurred with using the existing special waste approval for this additional excavation activity. The TDEC special waste approvals are included in Appendix A.

5.3 REMEDIATION ACTIVITY PERMIT

Remediation activity permits are required for installation or abandonment of monitoring wells, recovery wells, deep soil borings, GeoProbe[®], or any activity associated with remediation in Shelby County at depths greater than 30 ft. Since the depths of the direct push technology borings for the waste characterization samples were 20 ft, a remediation activity permit was not required.

6. REMEDIATION ACTIVITIES

Activities performed during the course of this remedial action included:

- waste characterization and profiling,
- excavation of contaminated soil,
- transportation and disposal of petroleum-contaminated soil,
- confirmatory soil sampling,
- site surveying,
- backfilling and compacting the excavation, and
- site restoration.

6.1 WASTE CHARACTERIZATION AND PROFILING

Because the existing Browning Ferris Industries, Inc. (BFI) waste profile had expired, additional waste characterization soil samples were collected to provide updated data for BFI. Representative samples of the contaminated soil were collected at two soil boring locations within the proposed excavation boundary. A GeoProbe[®] was used to perform the soil borings which were field screened using a photoionization detector to determine the most contaminated location within the boring. Samples 015WCS05 and 015WCS06 were collected from the most contaminated areas within the soil borings at depths of 9 ft to 12 ft below ground surface. The samples were submitted to Empirical Laboratories, LLC, (formerly ELAB of Tennessee, Inc.) and analyzed for Toxicity Characteristic Leaching Procedure metals, volatile organic compounds, and semivolatile organic compounds. Analytical data for the waste characterization samples are included in Appendix B. A generator waste profile was completed for the petroleum-contaminated soil and approved by BFI as shown in Appendix C-1. The special waste was then approved by BFI for disposal at their North Shelby Landfill as shown in Appendix C-2.

6.2 BACKFILL/BORROW MATERIAL CHARACTERIZATION

Previous sampling conducted during the original excavation activities of the one-site borrow soil pit owned by MIDB located in Millington, Tennessee, indicated the soil backfill material was free of contaminants. Therefore, additional sampling of the borrow pit was not required.

6.3 UTILITY IDENTIFICATION

Utility clearances for all underground and overhead utilities were obtained before intrusive activities began, and any interruptions of utility services were kept at a minimum.

6.4 SITE PREPARATION

Site preparations consisted of laying out the boundary of the excavation and installing silt fence (along west side of fence boundary) to prevent runoff from the excavation.

6.5 PRE-CONSTRUCTION SITE SURVEY

A civil site survey was performed before excavation began. This survey established the existing contours, proposed excavation boundary, and other site features as shown on Figure 3-3. The survey was performed by Allen & Hoshall, a registered land surveying company licensed in the state of Tennessee.

6.6 EXCAVATION OF CONTAMINATED SOILS

Using a tracked excavator, the petroleum-contaminated soil was excavated and loaded in trucks for transportation and disposal to the BFI North Shelby Landfill. The excavation began on the west side of the proposed excavation boundary and progressed across the site in an easterly direction. As the excavation progressed, the soil from the base or sidewall of the excavation was field screened using a photoionization detector.

When field screenings indicated clean material had been reached at the bottom or sidewall of the excavation, a representative sample was collected from the bottom or sidewall of the excavation to verify that the contaminated soil had been removed. In areas where the analytical results indicated TPH or benzene concentrations exceeding the site-specific cleanup level, the area was over-excavated and resampled.

To ensure proper vehicular access to the excavation and compliance with appropriate excavation and trenching regulations promulgated by the Occupational Safety and Health Administration, the excavation was sloped on a 2:1 ratio and/or benched. Given the nature of the soils (relatively firm silts, loams, and loesses), this slope ratio and benching sufficiently stabilized the sidewalls of the excavation while

allowing for efficient and safe access to the excavation. The additional excavation area is shown in Figure 6-1.

6.7 CONFIRMATORY SOIL SAMPLING

Soil sampling was performed to verify that the contaminated soil exceeding the site-specific cleanup levels had been removed from the proposed excavation boundary. Confirmatory soil samples were collected on approximately 20-ft intervals along the sidewalls and bottom of the excavated area at a depth of 0-6 inches. The soil samples were analyzed for the following:

- benzene, U.S. Environmental Protection Agency Method 8260A,
- Tennessee EPH, and
- Tennessee GRO.

All the samples were submitted to Empirical Laboratories, LLC, and analyzed on an expedited 24-hour turnaround time. The expedited turnaround time was used to assess whether material in excess of the site-specific cleanup levels had been removed. If any confirmatory soil sample exceeded site-specific cleanup levels, the “hot spot” area was over-excavated and resampled. Confirmatory soil sample locations are shown on Figure 6-1.

Based upon the analytical results from the confirmatory samples, TPH (TN-EPH plus TN-GRO) exceeded the site-specific cleanup level of 1,000 mg/kg in one sample. Benzene did not exceed its site-specific cleanup level of 100 mg/kg in any samples. Sample 015MT41S with concentrations of 2,400 mg/kg TN-EPH and 21 mg/kg TN-GRO, exceeded the TPH site-specific cleanup level. This south sidewall represented by Sample 015MT41S was over-excavated and resampled. Analytical results from the resampling of this section showed Sample 015MT41SB with concentrations of 11 mg/kg TN-EPH and 3.4J mg/kg TN-GRO which were below the site-specific cleanup level. The laboratory results were subjected to third party data validation. Table 6-1 presents the analytical results for the confirmatory soil samples. The validated analytical results and data validation report for the confirmatory soil samples are included in Appendix D.

Notes:

- Topographic information developed, and provided by Allen and Hoshall, Inc. of Memphis Tennessee, November 8, 2005.
 - All sample results are shown in "milligrams per kilogram".
 U= indicates the analyte was analyzed for, but not detected above the reported sample quantification limit or the reported analyte was not detected above 5x or 10x the level reported in laboratory or field blanks.
 J = indicates approximate concentration.
 D = indicates the sample was diluted by laboratory.
 - Sample collected from Over-Excavation.
 - Site specific clean-up levels were 100 milligrams/kilogram Benzene and 1,000 milligrams/kilogram Total Petroleum Hydrocarbons (TN-EPH plus TN-GRO).
- BGS = below ground surface
 EPH = extractable petroleum hydrocarbons
 GRO = gasoline range organics
 PID = photo ionization detector

7. WASTE MANAGEMENT

Waste management activities consisted of removal, transportation, and disposal of petroleum-contaminated soil. All waste management, transportation, manifesting, and record keeping were performed in accordance with applicable federal, state, and local laws and regulations.

The petroleum-contaminated soil was excavated and loaded directly into trucks for transportation to the BFI North Shelby Landfill. The nonhazardous waste manifests for each load of waste leaving the site are included Appendix E. The amount of petroleum-contaminated soil removed from SWMU 15 was approximately 2,480 tons (144 loads). Waste transportation was performed in accordance with applicable Department of Transportation rules and regulations. Daily weight totals of contaminated soil removed from SWMU 15 are presented in Table 7-1.

Table 7-1 Daily Weight Totals of Contaminated Soil Removed

Date	WasteType	Total Loads	Daily Total Weight (tons)	Cumulative Total Weight (tons)
11-1-05	Contaminated Soil	30	514	514
11-2-05	Contaminated Soil	30	519.56	1,033.56
11-3-05	Contaminated Soil	46	816.5	1,850.06
11-4-05	Contaminated Soil	37	629.86	2,479.92
11-10-05	Contaminated Soil	1	0.49	2,480.41
Totals		144		2,480.41

8. BACKFILL AND SITE RESTORATION

Backfilling activities began when the analytical results from the confirmatory soil samples verified the contaminated soil was removed from the excavations. The excavations were backfilled with soil from the MIDB's on-site borrow pit. The borrow soils were placed in 12-in lifts and compacted to 90%. Results of the compaction tests are included in Appendix F. Backfilling activities began on November 8, 2005, and were completed on November 10, 2005. Approximately 1,742 cubic yards (134 loads) of backfill soil were placed in the excavations. After the excavations were backfilled and graded for drainage, seed, fertilizer, and straw were applied to all disturbed areas. Photographs of the project activities are included in Appendix G.

9. CONCLUSIONS

The following summarizes the soil remediation at SWMU 15.

- Approximately 2,480 tons (144 loads) of petroleum-contaminated soil were excavated from the site and disposed as special waste at the BFI North Shelby Landfill.
- Twenty-eight confirmatory soil samples were collected from the excavations and analyzed for TN-EPH, TN-GRO, and benzene. One sample reported concentrations of TPH (TN-EPH plus TN-GRO) in excess of the site-specific cleanup level of 1,000 mg/kg. In Sample 015MT41S, the concentrations of TN-GRO and TN-EPH were 21 mg/kg and 2,400 mg/kg, respectively. This section represented by Samples 015MT41S was over-excavated and resampled. Sample 015MT41SB, collected after over-excavation, contained concentrations of 3.4 mg/kg TN-GRO and 11 mg/kg TN-EPH which were below the site-specific cleanup level. Results of the confirmatory soil sampling showed no concentrations of benzene in excess of the site-specific cleanup level of 100 mg/kg.
- A total of 1,742 cubic yards (134 loads) of borrow soil were used to backfill the excavations.

RE: Special Waste Approval for Naval Support Activity Mid South, SWMU-15

Dear Mr. Sereles:

This office has received a Special Waste Approval Request from you on behalf of NSAM, located in Millington, submitted according to Tennessee Rule Chapter 1200-1-7-.01(4). The request was for disposal of approximately 35,000 tons (one time only) of petroleum contaminated soil from excavation of soils at SWMU-15, the former fuel farm. After reviewing the analytical data submitted with the request it has been determined that the material is suitable for disposal at the Browning - Ferris Industries North Shelby (SNL791060224) or South Shelby (SNL791060135) Landfills.

Please be advised that the facility operator may refuse to accept any special waste, even if the Division has approved it.

If you have any questions please feel free to contact me at (901) 368-7950.

Sincerely,

Leland Hares, P.G.

Subject: Re: Additional Excavation at SWMU 15

Mr. Sherles:

After reviewing your request and the existing Special Waste Permit, we are in agreement that the additional soil may be disposed of under the existing permit. No additional approval is required unless there is a significant change in the nature of the waste.

Leland Hares, P.G.
DSWM/MEFO

>>> "Rob Sherles" <rob@stepenv.com> 10/18/05 1:18 PM >>>
Mr. Hares,

STEP, Inc. will excavate an additional 3,300 cubic yards (3,000 tons) of petroleum-contaminated soil from Naval Support Activity Mid-South, SWMU 15, under the Special Waste Approval granted on September 9, 2003, by TDEC/DSWM, which included the disposal of 35,000 tons petroleum-contaminated soil at the BFI North Shelby or South Shelby Landfills. On November 3, 2003, TDEC/DSWM increased the disposal to 65,000 tons (see attachment) at the request of STEP, Inc. due to the more than expected soil contamination at the site. During Phase I, approximately 57,168 tons of petroleum-contaminated soil was excavated and disposed from SWMU 15. Per our conversation today and your concurrence, the additional excavation of 3,000 tons of petroleum-contaminated soil from SWMU 15 will not exceed the existing Special Waste Approval of 65,000 tons, and a new Special Waste Approval will not be required by TDEC/DSWM. In addition, a new BFI waste profile will be completed for the additional 3,000 tons of soil. If you have any questions, feel free to call Roy Hoekstra or myself at 865-481-7837.

Thanks,
Robert Sherles
STEP, Inc.

ANALYTICAL REPORT TERMS AND QUALIFIERS (ORGANIC)

- MDL:** The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The MDL is determined from analysis of a sample containing the analyte in a given matrix.
- EQL:** The estimated quantitation limit (EQL) is defined as the estimated concentration above which quantitative results can be obtained with a specific degree of confidence. ELAB defines the EQL to be at or near the lowest standard of the calibration curve.
- U:** The presence of a "U" indicates that the analyte was analyzed for but was not detected or the concentration of the analyte quantitated below the MDL.
- B:** The presence of a "B" to the right of an analytical value indicates that this compound was also detected in the method blank and the data should be interpreted with caution. One should consider the possibility that the correct sample result might be less than the reported result and, perhaps, zero.
- D:** When a sample (or sample extract) is rerun diluted because one of the compound concentrations exceeded the highest concentration range for the standard curve, all of the values obtained in the dilution run will be flagged with a "D".
- E:** The concentration for any compound found which exceeds the highest concentration level on the standard curve for that compound will be flagged with an "E". Usually the sample will be rerun at a dilution to quantitate the flagged compound.
- J:** The presence of a "J" to the right of an analytical result indicates that the reported result is estimated. The mass spectral data pass the identification criteria showing that the compound is present, but the calculated result is less than the EQL. One should feel confident that the result is greater than zero and less than the EQL.
- P:** The associated numerical value is an estimated quantity. There is greater than a 40% difference between the two GC columns for the detected concentrations. The higher of the two values is reported unless matrix interference is apparent.

ELAB of TENNESSEE
Formerly Eckerd's Laboratory

ANALYTICAL REPORT NOTES, TERMS AND QUALIFIERS (INORGANIC)

Notes:

The metals and cyanide reporting limits (RLs) have been statistically determined to be no less than three standard deviations as defined in 40 CFR 136, Appendix B, Revision 1.11. All other reporting limits are referenced from the specific analytical method.

Terms:

NA Not Applicable

NR Not Requested

Qualifiers:

- B The reported value is less than the practical quantitation limit (PQL, project defined) but greater than or equal to the MDL.
- E The reported value is estimated due to the presence of matrix interference.
- N Predigested spike recovery not within control limits.
- * RPD or absolute difference for Duplicate analysis not within control limits.
- ** Reference Standard Methods 19th edition.
- (1) pH analyzed outside USEPA specified holding time. pH must be measured immediately after sample collection.
- (2) The sample pH did not meet the preservation guidelines. Therefore the pH was adjusted upon receipt.
- (3) Reference Standard Methods 17th edition for the distillation method.
- (4) The sample was analyzed out of the USEPA holding time.
- (5) The sample was received in the laboratory out of the USEPA holding time.
- (6) The shipping cooler temperature exceeded 6°C upon receipt to ELAB of Tennessee, LLC.
- (7) Analysis was subcontracted

Is this waste generated in a Federal Superfund Clean Up Site?						<input type="checkbox"/> Yes or <input checked="" type="checkbox"/> No

VI. Generator Certification

I hereby certify that to the best of my knowledge and belief, the information contained herein is a true, complete and accurate description of the waste material being offered for disposal and all known or suspected hazards have been disclosed. All Analytical Results/Material Safety Data Sheets submitted are truthful and complete and are representative of the waste. I further certify that by utilizing this profile, neither myself nor any other employee of the company will deliver for disposal or attempt to deliver for disposal any waste which is classified as toxic waste, hazardous waste or infectious waste, or any other waste material this facility is prohibited from accepting by law. I shall immediately give written notice of any change or condition pertaining to the waste not provided herein. Our company hereby agrees to fully indemnify this disposal facility against any damages resulting from this certification being inaccurate or untrue. I further certify that the company has not altered the form or content of this profile sheet as provided by Allied Waste.

Re: **Approval of Special Waste Stream**
BFI Waste Code: TN/ 060430/ L42Y514377
Waste Description: Contaminated Soil

Dear Customer,

The preceding special waste stream has been approved for disposal at our BFI North Shelby Landfill. This BFI approval is valid through April 30, 2006. The State of Tennessee approval is good until 65,000 tons.

Please include the entire BFI Waste Code number on each manifest brought to the landfill, as an incomplete number could result in a delay and/ or rejection of the load. We appreciate the opportunity to be of service to you and your company. Should you have any questions or need additional information, please do not hesitate to give me a call at (901) 873-8335.

Sincerely,

A handwritten signature in black ink that reads "Shana S. Fristick". The signature is written in a cursive style.

Shana S. Fristick
Special Waste Consultant
BFI Memphis Landfills

Appendix D-1
Analyses for Extractable Petroleum Hydrocarbons

SOIL SAMPLES : MILLINGTON

1.0 Introduction

The data validation of thirty soil samples in four sample groups (SDGs) from the SWMU-15, Millington Naval Facility (MNF) has been completed in November 2005. Level III data validation was performed on 100% of the environmental samples. ELAB, Nashville, TN, analyzed all samples for the following:

Parameter (Method)
Benzene by GC/MS SW846 8260B
EPH by TN Specific Method
GRO by TN Specific Method

2.0 Procedures

The sample data were validated following the logic identified in the *CLP National Functional Guidelines for Organic Data Review (October 1999)* and method specific criteria.

3.0 Summary of Data Validation Findings

This data validation report reflects the data validation findings for samples associated with SWMU-15 at MNF. The validated data set consisted of thirty samples that had been analyzed for benzene, EPH and GRO. Overall the data was of excellent quality and all measurements required to satisfy the project QC objectives, PARCC were met. Each of these measures and specific data qualifications are discussed below.

Accuracy: Accuracy is measured by the results from the recovery of known amounts of compounds or elements from laboratory control samples (LCS), matrix spikes (MS) and surrogate recoveries. The overall measure of accuracy for SWMU-15 was calculated by comparing the number of spike recoveries that exceeded the laboratory limits by the total number of LCS, MS and surrogate spikes. For all analyte groups accuracy was measured at 99.5%.

Precision: Precision is a measure of the agreement between duplicate sample measurements of the same quantity and is reflected in the RPD between spikes and the RPD for the field duplicate analysis. Precision for SWMU-15 was measured at 95.7%.

Representativeness: The measures of representativeness – sample handling, analytical blank analysis, field blanks – were met for all sites. Designated analytical protocols were followed. Holding times were met. Overall, no major problems were identified resulting from analytical failure.

Comparability: All data were analyzed using appropriate approved methods of analysis. All data results were reported correctly and in standard units

Completeness: Completeness is the amount of valid data compared to the planned amount and is expressed as a percent of the usable data points divided by the total number of analytes for each parameter analyzed. Out of a total of ninety data points, no data points were rejected, resulting in a completeness of 100%.

Several sample results for the organic compounds were assigned “J” qualifiers by the laboratory, which is standard practice for these methods, because they were quantitated between the method detection limit (MDL) and the reporting limit (RL). Due to the uncertainty associated with this region of quantification, the validation reviewer retained the “J” qualifiers the laboratory assigned to indicate an estimated quantity.

Data validation summaries, which function as worksheets for the validation task, are included for each parameter in each data package. The following section highlights the key findings of the data validation for each analysis.

4.0 Analysis-Specific Data Validation Summaries

4.1 Benzene by SW846 8260B

Thirty soil samples were analyzed for benzene. Overall, the data are of good quality and are usable as reported by the laboratory. Data were reviewed for the following:

Holding Times/Sample Condition. Holding times were met for all sample analyses. All samples were received in acceptable condition.

Initial Calibration (ICAL) and Continuing Calibration (CCAL). All initial and continuing calibrations associated with the project samples met QC criteria.

Blanks. No contaminants were found in the associated method or calibration blanks.

Surrogate Recoveries. All surrogate recoveries were within the QC limits and no qualifiers were required.

Matrix Spike/Matrix Spike Duplicate (MS/MSD). All MS/MSD analyses were acceptable. No qualifiers were required.

Laboratory Control Sample (LCS). LCS analyses were performed and all QC criteria were met.

Internal Standards (IS). The internal standard area count recoveries and the retention times windows were within the QC limits and no qualifiers were needed.

Field Duplicates (FD). All field duplicate analyses results were within the QC limits.

Quantification. All results were acceptable as reported.

4.2 EPH by TN Specific Method

Overall, the data are of good quality and are usable as reported by the laboratory. Data were reviewed for the following:

Holding Times/Sample Condition. Technical holding time criteria were met for all samples. All samples were received in acceptable condition.

Initial and Continuing Calibration. The initial calibration analysis and continuing calibrations analysis were within the QC limits.

Blanks. No contamination was noted in the associated method blanks.

Surrogate Recoveries. All surrogate recoveries were within the QC limits.

Internal Standards. All internal standard recoveries were within the QC limits.

Matrix Spike/Matrix Spike Duplicates (MS/MSD). The MS/MSDs results were within the QC limits.

Laboratory Control Sample (LCS). No qualifiers were required since all LCS recoveries were within the QC limits.

Field Duplicates. All field duplicate analyses results were acceptable.

Quantification. The results in samples 015MT40B, 015MT41S and 015MT42B (SDG 0511011) exceeded the instrument calibration limit and dilutions were analyzed. The dilution result was acceptable.

4.3 GRO by TN Specific Method

Overall, the data are of good quality and are usable as reported by the laboratory. Data were reviewed for the following:

Holding Times/Sample Condition. Technical holding time criteria were met for all thirty soil samples. All samples were received in acceptable condition.

Initial and Continuing Calibration. All initial calibration and continuing calibration verification results were within acceptable limits.

Blanks. No contamination was noted in the associated method blanks.

Surrogate Recoveries. All surrogate recoveries were within the QC limits

Matrix Spike/Matrix Spike Duplicates (MS/MSD). All MS/MSDs results were within the QC limits.

Laboratory Control Sample (LCS). No qualifiers were required since all LCS recoveries were within the QC limits.

Field Duplicates. The field duplicate RPD was outside the QC limit for SDG 0511033, samples 015 MT50B and 015MT50BDUPL, and the results were qualified as "J".

Quantification. All results were acceptable as qualified.

5.0 Data Qualifier Definitions

Qualifier

- U** The analyte was analyzed for, but was not detected above the reported sample quantification limit or the reported analyte value was not detected above 5x or 10x the level reported in laboratory or field blanks.
- J** The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
- R** The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.

Table 1: Data Validation Reason Codes

Reason Code	Definition
01	Sample received outside of 4+/-2 degrees Celsius
01A	Improper sample preservation
02	Holding time exceeded
02A	Extraction
02B	Analysis
03	Instrument performance – outside criteria
03A	BFB
03B	DFTPP
03C	DDT and/or Endrin % breakdown exceeds criteria
03D	Retention time windows
03E	Resolution
04	Initial calibration results outside specified criteria
04A	Compound mean RRF QC criteria not met
04B	Individual % RSD criteria not met
04C	Correlation coefficient >0.995
05	Continuing calibration results outside specified criteria
05A	Compound mean RRF QC criteria not met
05B	Compound % D QC criteria not met
06	Result qualified as a result of the 5x/10x blank correction
06A	Method or preparation blank
06B	ICB or CCB
06C	ER
06D	TB
06E	FB
07	Surrogate recoveries outside control limits
07A	Sample
07B	Associated method blank or LCS
08	MS/MSD/Duplicate results outside criteria
08A	MS and/or MSD recovery not within control limits (accuracy)
08B	% RPD outside acceptance criteria (precision)
09	Post digestion spike outside criteria (GFAA)
10	Internal standards outside specified control limits
10A	Recovery
10B	Retention time
11	Laboratory control sample recoveries outside specified limits
11A	Recovery
11B	% RPD (if run in duplicate)
12	Interference check standard
13	Serial dilution
14	Tentatively identified compounds
15	Quantification
16	Multiple results available; alternate analysis preferred

17	Field duplicate RPD criteria is exceeded
18	Percent difference between original and second column exceeds QC criteria
19	Professional judgment was used to qualify the data
20	Pesticide clean-up checks
21	Target compound identification
22	Radiological calibration
23	Radiological quantification
24	Reported result and/or lab qualifier revised to reflect validation findings

ENGINEERING-INSPECTION-TESTING
1579 THREE PLACE
MEMPHIS, TENNESSEE 38116

Client **STEP, INC.**
Oak Ridge, Tennessee

Project **Soil Excavation and Disposal at SWMU 15**
Contract No. N62467-02-D-0269

Location **N S A Mid-South**
Millington, Tennessee

FIELD DENSITY TEST REPORT

Field Work Order No. 05-11-026

Page 1 of 1

Date Tests Performed **November 10, 2005 (Thursday)**

Tests Performed By **CQC (GFP)**

Test Methods:

Moisture-Density Relations **ASTM D 698**
In-Place Density **ASTM D 2922 (Nuclear)**
In-Place Moisture **ASTM D 3017 (Nuclear)**

Test Designation	In-Place Density (PCF)	In-Place Moisture (%)	Reference Curve Number	Maximum Density (PCF)	Optimum Moisture (%)	Moisture Variance (%)	Compaction Obtained (%)	Compaction Required (%)	Retest Required (Yes/No)
Backfill of East Excavation, Approx. 55' North and 22' East of the Southwest Corner of Excavation, Approx. 2' Below Final Soil Grade (12" Test)									
05-11-026A	97.6	8.7	L11981	107.3	16.5	- 7.8	91.0	90	No
Backfill of East Excavation, Approx. 15' North and 30' East of the Southwest Corner of Excavation, Approx. 4' Below Final Soil Grade (12" Test)									
05-11-026B	97.9	11.0	L11981	107.3	16.5	- 5.5	91.2	90	No
Backfill of East Excavation, Approx. 28' North and 10' East of the Southwest Corner of Excavation, Approx. 3' Below Final Soil Grade (12" Test)									
05-11-026C	97.1	18.6	L11981	107.3	16.5	+ 2.1	90.5	90	No
Backfill of West Excavation, Approx. 60' North and 40' East of the Southwest Corner of Excavation, Approx. at Final Soil Grade (12" Test)									
05-11-026D	97.9	20.1	L11981	107.3	16.5	+ 3.6	91.2	90	No

Project Photographs

View of SWMU 15 before additional excavation began.

View of SWMU 15 before additional excavation began. Waste characterization sample location and boundary stakes shown in photograph.

South view of SWMU 15 before additional excavation activities began.
East boundary stakes shown in photograph.

Silt fence installed west of the proposed excavation boundary.

View of west excavation.

View of west excavation. Sewer pipe and confirmatory soil sample locations shown in photograph.

View of west excavation. Sewer pipe and confirmatory soil sample locations shown in photograph.

View of sewer pipe and confirmatory soil sample locations in west excavation.

Removing contaminated soil from east excavation.

View of east excavation.

View of sidewall in east excavation

View of east excavation.

View of east and west excavations.

View of east excavation. South sidewall benched in background.

View of over-excavation in south sidewall (east excavation) after TPH concentrations from Sample 015MT041S exceeded cleanup level.

View of east sidewall of east excavation. Plastic sheeting placed in the original excavation in 2003 shown in background.

View of east excavation. North sidewall benched in background.

View of east excavation.

Backfilling east excavation with borrow soil.

Spreading borrow soil in the east excavation.

View of east excavation during backfilling.

Fill sand placed around sewer pipe in the west excavation before backfilling and compacting.

View of east excavation during backfilling.

Compacting borrow soil in east excavation.

Backfilling west excavation with borrow soil.

Compacting borrow soil in west excavation.

Performing compaction test in east excavation.

View of east excavation during backfilling.

Compacting borrow soil in west excavation.

Compacting borrow soil in west excavation.

Unloading borrow soil in east excavation.

Unloading borrow soil in east excavation and regrading area for drainage.

Regrading area for drainage after backfilling excavations.

Disturbed areas restored with seed, fertilizer, and straw.

Disturbed areas restored with seed, fertilizer, and straw.

Disturbed areas restored with seed, fertilizer, and straw.
