EXECUTIVE SUMMARY

This report details the findings of the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) for Solid Waste Management Unit (SWMU) 1, the Fire Department Drill Area (FDDA), at Naval Support Activity (NSA) Memphis in Millington, Tennessee. The following briefly summarizes the RFI report.

SWMU 1, within the west-central portion of the NSA Memphis Northside, comprises an asphalt area of approximately 1.5 acres at the west end of inactive Runway 09. The FDDA was within the 200-foot wide asphalt runway which is in poor condition because of weathering and lack of maintenance. Presently, remnants of the FDDA consist of a 20-foot X 20-foot area enclosed by railroad rails formerly used for burning operations and a 6-foot high pile of soil west of the burn area. SWMU 1 is bound on the west, north, and south by cultivated fields, and on the northeast and southeast by the grass apron adjacent to active Runway 04.

SWMU 1 was reportedly used as a simulated crash site for fire-fighting training from 1960 through 1984. Monthly fire training consisted of spraying fuel on an aircraft shell within the 20-foot square box, igniting it, and extinguishing the fire. Approximately 55 to 100 gallons of fuel were used in each training session.

Subsurface soil samples collected during a 1992 Interim Measures (IM) investigation were analyzed for volatile organic compounds (VOCs), total petroleum hydrocarbons (TPH) (by gas chromatograph/flame ionization device), cadmium, chromium, and lead. Soil samples from three locations (Borings 5, 11, and the background boring) were additionally analyzed for semivolatile organic compounds (SVOCs), cyanide, pesticides/polychlorinated biphenyls (PCBs), TPH (by USEPA Method 418.1), and Appendix IX metals. As part of the RFI, in 1995 a Direct Push Technology (DPT) survey was conducted to sample subsurface soil and groundwater; these samples were analyzed for VOCs only to determine whether any contamination that might be present had migrated vertically downward. VOCs were selected as an indicator parameter because of their mobility and because they include constituents of potential site contaminants

(solvents and petroleum). Surface soil samples (0 to 1 foot deep) collected in January 1996 for preliminary risk evaluation preparation were analyzed for VOCs, SVOCs, herbicides, pesticides/PCBs, Appendix IX metals, and TPH Gasoline Range Organics and Diesel Range Organics. Each contaminant group is discussed below, including those exceeding Risk-Based Concentrations (RBCs), Soil Screening Levels (SSLs) (USEPA Region III, June 1996), and/or two times (2X) mean background reference concentrations (RCs) for inorganics. Stockpiled soil west of the burn area also was sampled for disposal purposes.

Conclusions

- No SVOCs, herbicides, or organophosphorus pesticides were detected in any soil samples. Additionally, no VOCs detected in soil exceeded their respective RBCs or SSLs and no metals were detected in soil exceeding both their RBCs or SSLs and their RCs.
- One surface soil sample exhibited an elevated TPH concentration (390 mg/kg) exceeding the Tennessee Department of Environment and Conservation, Division of Solid Waste Management, State Remediation Section action level of 100 milligrams per kilogram. However, this was an isolated occurrence.
- Dieldrin was the only detected site constituent in surface soil exceeding its residential RBC and SSL. Dieldrin is ubiquitous at NSA Memphis from aerial applications in the 1950s and 1960s resulting from a U.S. Department of Agriculture quarantine on the white-fringed beetle. A June 1995, technical memorandum, *Discussion of Dieldrin Risk Management Issues*, concluded "... dieldrin levels found at each SMWU do not necessitate remedial action in the absence of other significant carcinogenic risk contributors."
- Groundwater samples collected at SWMU 1 during the DPT survey were analyzed for VOCs to determine whether solvent or petroleum contamination, if any, had migrated

vertically downward. No VOCs were detected in any of the samples analyzed in the onsite laboratory.

- The soil stockpile within SWMU 1, of unknown origin, was sampled and analyzed first for a full-scan analysis and then for disposal characterization. Toluene, chlorinated herbicides, chlorinated pesticides, metals, and TPH were detected in the full scan analysis sample. Except for barium, the results of the toxicity characteristic leaching procedure (TCLP) analyses, necessary for disposal, were less than detection limits. The barium concentration (0.92 mg/kg) was less than the TCLP limit (100 mg/kg) and was therefore not a characteristic hazardous waste. The soil stockpile was transported offsite for disposal as nonhazardous waste in June 1996.
- A Preliminary Risk Evaluation (PRE) was conducted in accordance with *Guidance on Preliminary Risk Evaluations for the Purpose of Reaching a Finding of Suitability to Lease* (USEPA Region IV Memorandum, November 1994). Data from the three SWMU 1 surface soil samples were used to perform the PRE. The risk sums for carcinogenic site contaminants were 2×10^{-5} and 3×10^{-6} for residential and industrial use scenarios, respectively. A site exceeding a risk threshold of 1×10^{-4} generally indicates that additional investigation is required. The Hazard Indices (HI) for noncarcinogenic site constituents were 0.3 and 0.01 for residential and industrial use scenarios, respectively. An HI greater than 1 generally indicates the site will require further investigation. Based on the PRE, SWMU 1 is suitable for either residential or industrial land use.
- No significant habitat features were identified at SWMU 1 that could provide shelter, substantive food or water, or a mixture of cover types for wildlife. This absence of habitat, and thus receptors, limits the potential for ecological risk.

Recommendations

Based on the information gathered during the RFI conducted for SWMU 1, risk to human health and the environment associated with the constituents detected onsite should be minimal. No further action is recommended for SWMU 1.

1.0 INTRODUCTION

As part of the U.S. Navy's Installation Restoration program, the following Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) report has been prepared for Solid Waste Management Unit (SWMU) 1, the Fire Department Drill Area (FDDA), at Naval Support Activity (NSA) Memphis, Millington, Tennessee. SWMU 1 was scheduled for an RFI because of the former Naval Air Station (NAS) Memphis fire department burning operations conducted onsite.

As a result of the Base Closure and Realignment Act (BRAC) of 1990, a portion of NSA Memphis that includes SWMU 1 is being closed and transferred to the City of Millington for reuse. SWMU 1 is one of 15 SWMUs at NSA Memphis requiring a full RFI because of known or suspected releases of contaminants; 35 other SWMUs are undergoing Confirmatory Sampling Investigations (CSIs). The RFI SWMUs have been categorized into three assemblies (A, B, and E) according to their BRAC status. The FDDA is one of six Assembly A SWMUs. Assemblies A and B, on the Northside, are within the closing portion of NSA Memphis, while Assembly E, on the Southside, is within the portion that will realign and remain open. Closing Assemblies C and D and realigning Assemblies F, G, and H are undergoing CSIs.

This RFI, undertaken by EnSafe/Allen & Hoshall (E/A&H) and the U.S. Geological Survey (USGS), adhered to the requirements of the Hazardous and Solid Waste Amendments portion (HSWA-TN02) of RCRA Permit No. TN2-170022-600 and applicable regulations. This report summarizes activities conducted during the investigation and the resulting findings and conclusions.

2.0 SITE DESCRIPTION AND BACKGROUND INFORMATION

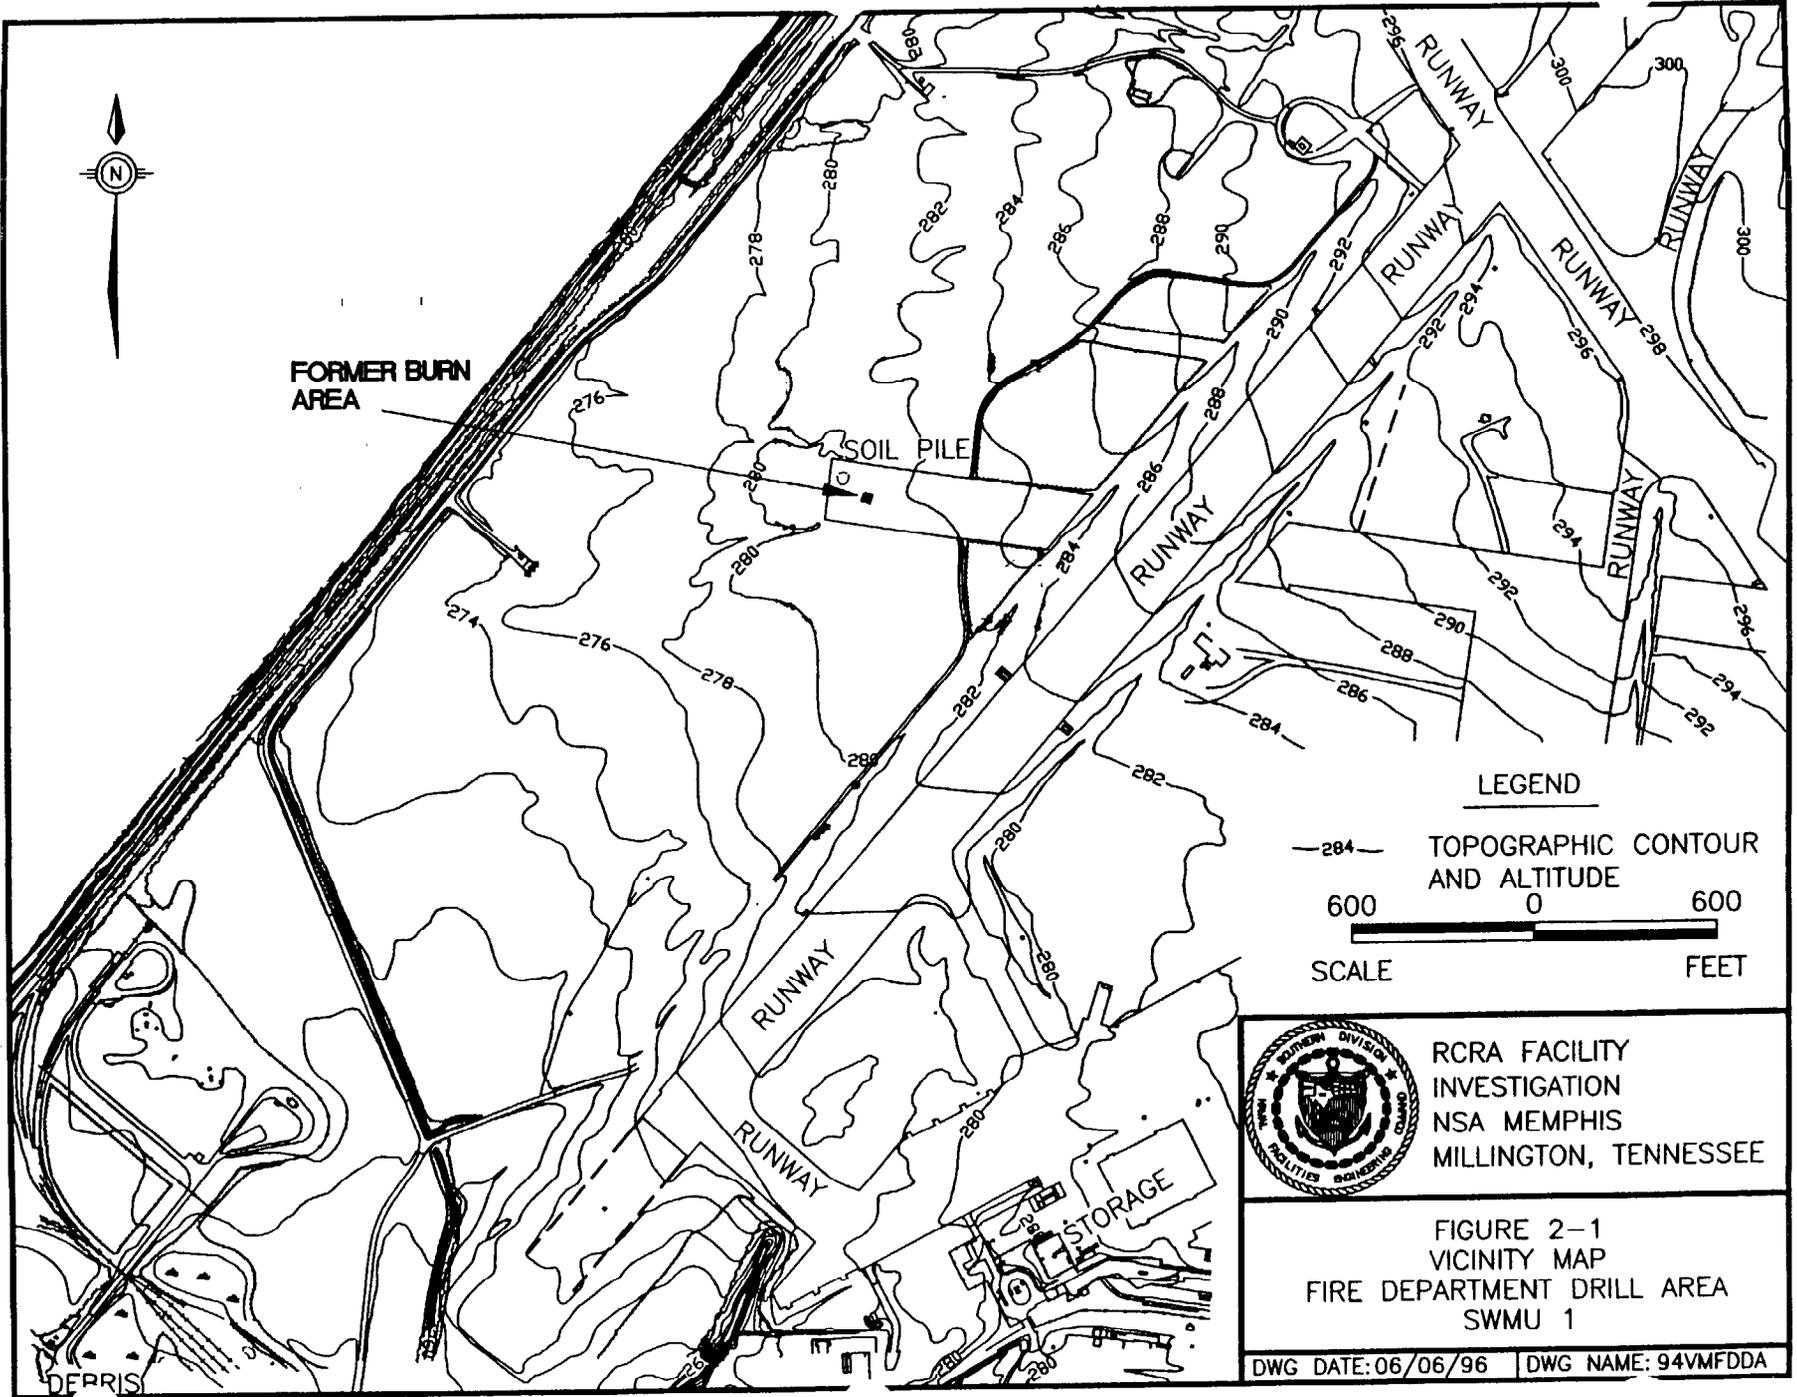

SWMU 1, within the west-central portion of the NSA Memphis Northside, comprises an asphalt area of approximately 1.5 acres at the west end of inactive Runway 09. The FDDA was within the 200-foot wide asphalt runway which is in poor condition because of weathering and lack of maintenance. Presently, remnants of the FDDA consist of a 20-foot X 20-foot area enclosed by railroad rails formerly used for burning operations and a 6-foot high pile of soil west of the burn area. SWMU 1 is bound on the west, north, and south by cultivated fields, and on the northeast and southeast by the grass apron adjacent to active Runway 04.

Topography at the site consists of a subtle, 1% to 3%, downward slope to the west. The western end of Runway 09 and the FDDA drain to the southwest to a point approximately 800 feet west of the site, where runoff is collected by a north-south drainage ditch near the western perimeter of the NSA Memphis Northside. This drainage ditch empties into North Fork Creek, approximately 4,000 feet southwest of the site. No surface water bodies are within 1,000 feet of the SWMU. A vicinity map of SWMU 1 is provided in Figure 2-1 and a site map of SWMU 1 is presented in Figure 2-2.

SWMU 1 was reportedly used as a simulated crash site for fire-fighting training from 1960 through 1984. Monthly fire training consisted of spraying fuel on an aircraft shell within the 20-foot square box, igniting it, and extinguishing the fire. Approximately 55 to 100 gallons of fuel were used in each training session.

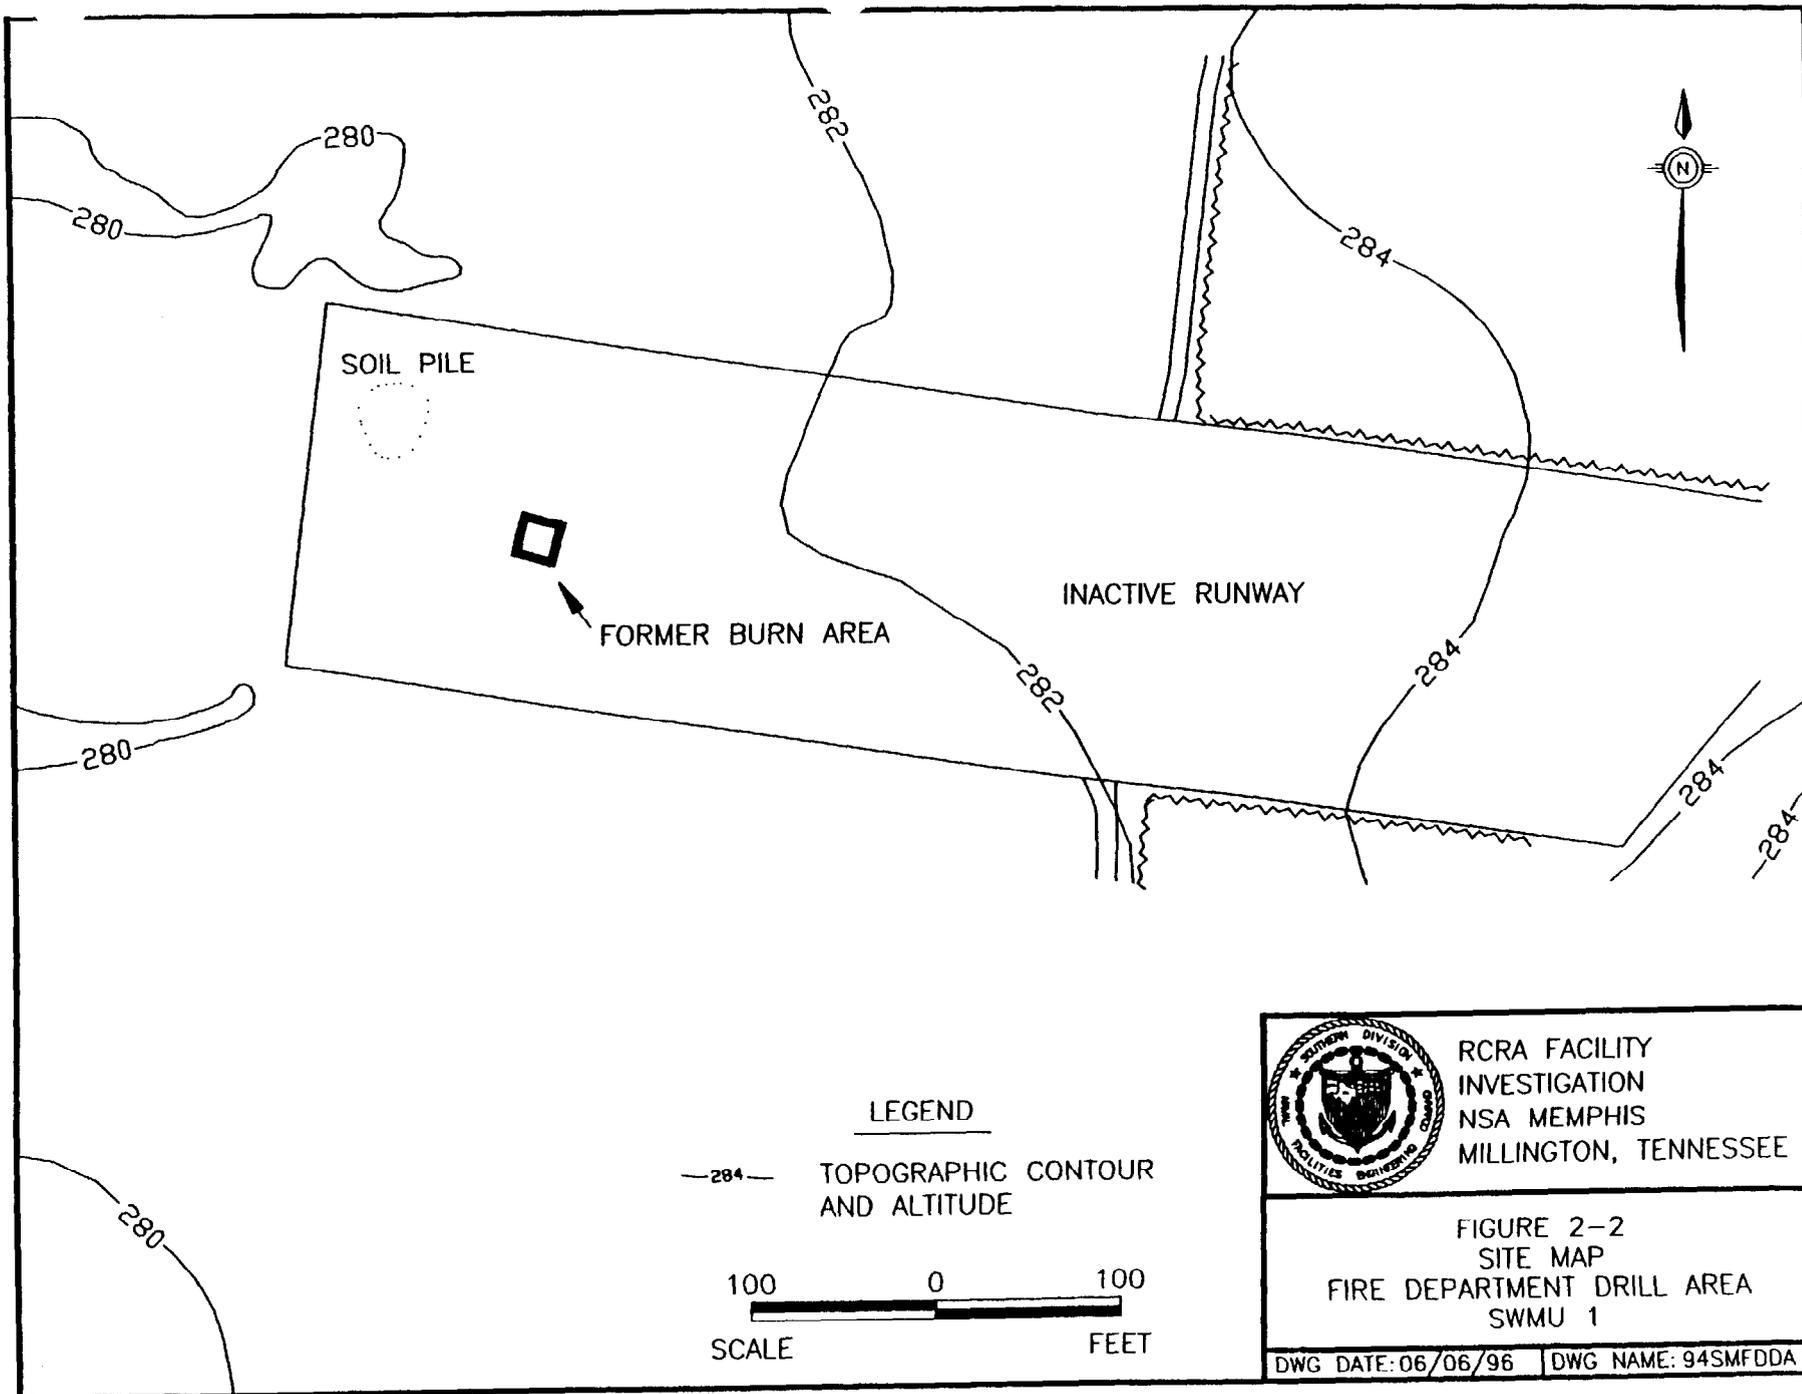

SWMU 1 reportedly contained two aboveground storage tanks (ASTs). One AST of unknown capacity was immediately east of the aircraft shell, while the second AST, elevated on a steel stand, with a reported capacity of 200 gallons was on the northwest side of the burn area. Both ASTs were within a containment area, an asphalt area surrounded by railroad rails. Cracks in the asphalt may have allowed fuel to penetrate the underlying soil. Before the late 1970s, no containment (i.e., railroad rails) was in place. These tanks are no longer onsite.

Aviation fuel (JP-4) and waste fuels, such as deplaned fuels from aircraft, were used in the burning operations. Naphtha, xylene, toluene, and benzene were constituents of JP-4 fuel. The *RCRA Facility Assessment* (ERC/EDGE, 1990) reported the common practice of mixing waste fuel with waste solvents such as naphtha, xylene, methyl ethyl ketone, toluene, and benzene during burning operations at the FDDA. In addition, the waste fuels reportedly may have contained lead, cadmium, and chromium. Polychlorinated biphenyls (PCBs) were not likely to have been mixed in with the waste fuels, but they were evaluated during the RFI.

3.0 PRELIMINARY INVESTIGATIONS

Previous studies conducted at SWMU 1 include an Initial Assessment Study (IAS), a soil-gas survey, and an Interim Measures (IM) investigation. The IM investigation was performed in October and November 1992 to expedite a proposed lease of 50.5 acres, including SWMU 1, to the City of Millington for a joint-use air facility by Millington and the former NAS Memphis. The IM investigation was conducted to determine if previous activities at the FDDA had contaminated the soil and, if so, whether corrective measures should be implemented before leasing the land. Lease of the 50.5 acres no longer applies since the area, including SWMU 1, is being transferred to the City of Millington as part of BRAC. Previous investigations are summarized below.

3.1 Initial Assessment Study — Harmon Engineering (1983)

An IAS conducted in 1983 did not recommend SWMU 1 for a confirmation study (Harmon Engineering & Testing/NEESA, 1983). Additionally, a Visual Site Inspection conducted on April 19, 1990, by the Navy and the USGS identified no adverse conditions such as stained soil at or near the burn area within SWMU 1.

3.2 Soil-Gas Survey — USGS (May 1991)

The USGS performed a soil-gas survey at SWMU 1 in May 1991. A summary of the survey and the data generated were included in the *Assembly A Site Investigation Plans* (E/A&H, 1994a). Relatively low-level values (sums of volt-seconds for peaks of unidentified compounds ranging from 0.1 to 16.7) were reported for most sampling stations. The highest values were reported at stations along the centerline of the old runway and near the former burn area.

3.3 Interim Measures Investigation — USGS and E/A&H (October-November 1992)

The IM investigation, performed by the USGS between October 26 and November 6, 1992, consisted of 26 soil samples from 12 shallow borings (less than 15 feet) submitted for laboratory

analysis. In addition, two soil samples from a shallow boring drilled 800 feet west of SWMU 1 and two soil samples were submitted for laboratory analysis to provide background information. No groundwater monitoring wells were installed as part of the IM investigation.

Boring locations are provided in Figure TM-2 of the *Technical Memorandum — Interim Measures Field and Analytical Summary for SWMU 1* (SOUTHDIV, USGS, and E/A&H, 1993). This technical memorandum is provided as Appendix A of this report.

All soil samples except those from Borings SB-5, SB-12, and the background boring were analyzed for:

- Aromatic volatile organic compounds (VOCs) by U.S. Environmental Protection Agency (USEPA) Method 8020.
- Total petroleum hydrocarbons (TPH) by gas chromatograph/flame ionization detection (GC/FID).
- Total cadmium, chromium, and lead by USEPA Methods 7130, 7190, and 7421.

Soil samples collected from Borings SB-5, SB-12, and the background boring were analyzed for the following parameters:

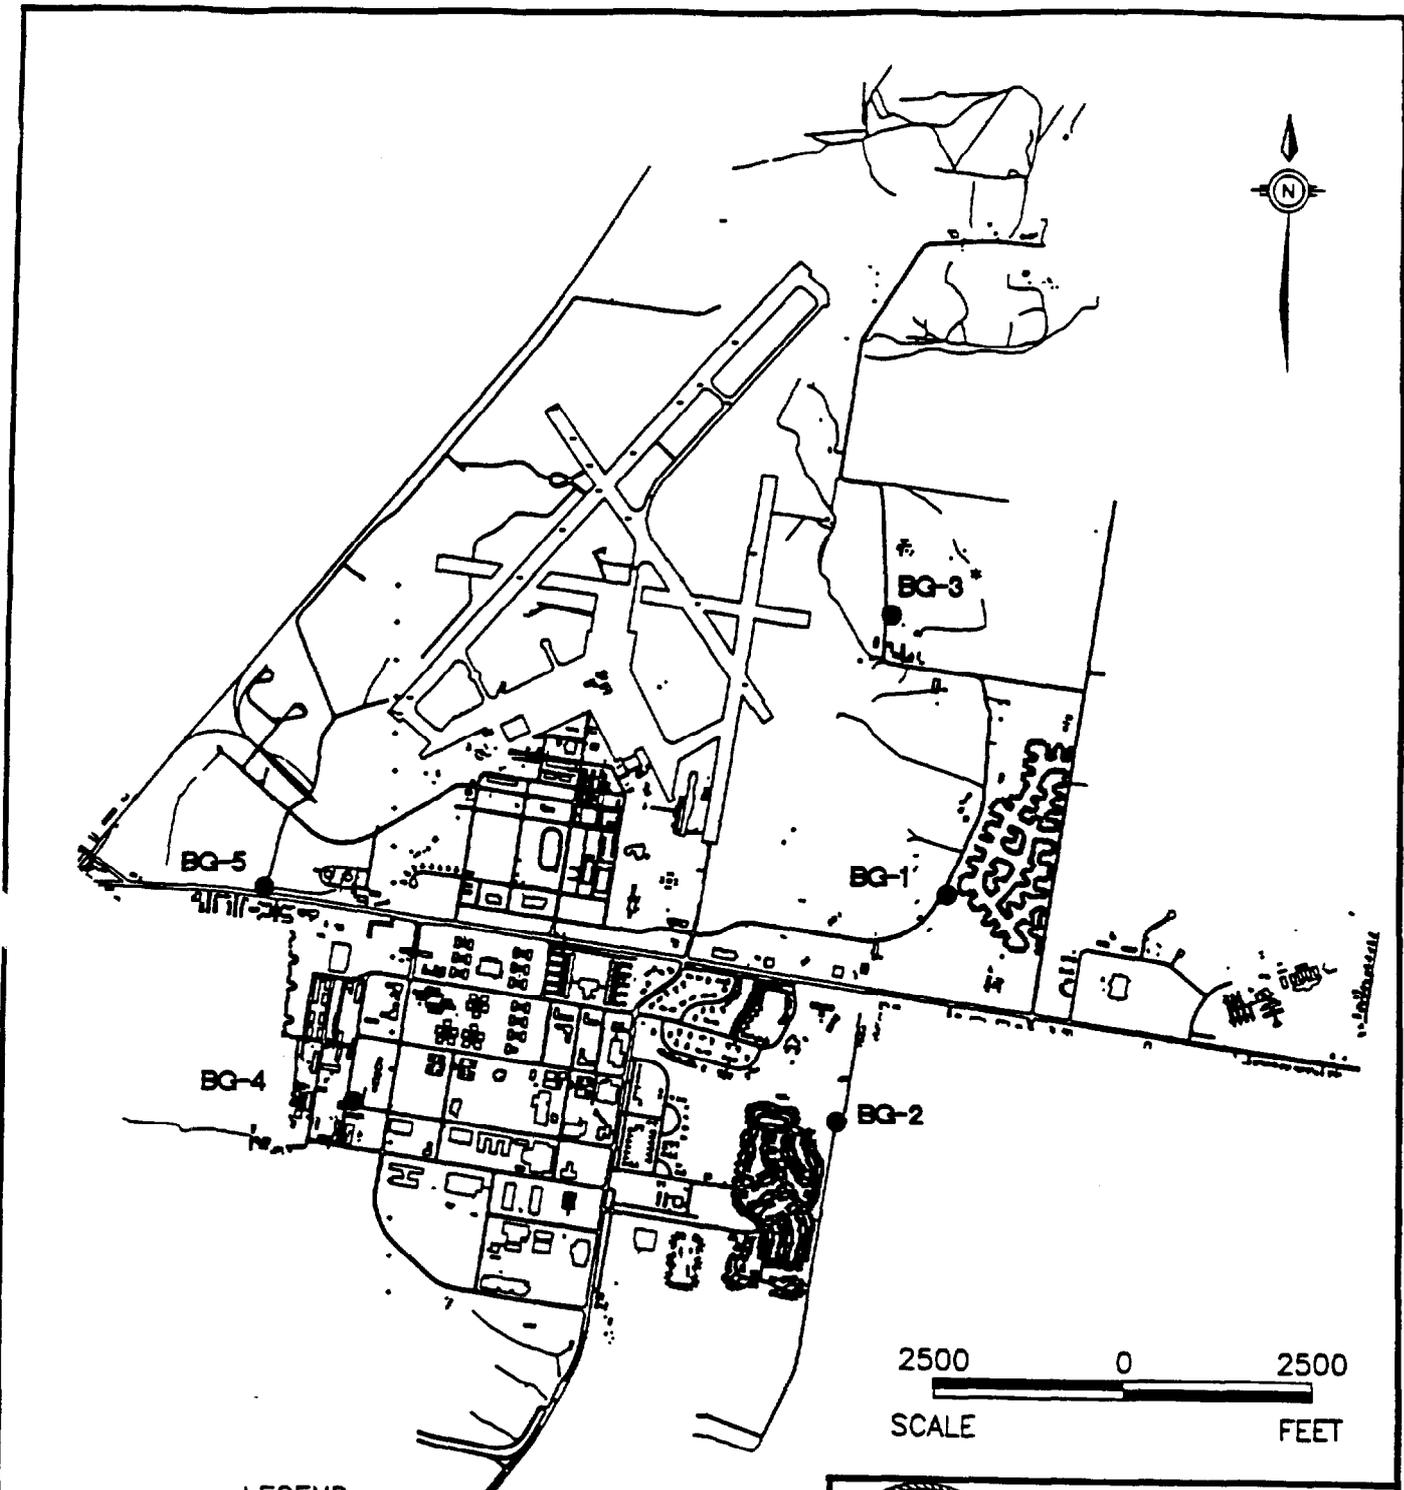

- VOCs by USEPA Method 8240.
- Semivolatile organic compounds (SVOCs) by USEPA Method 8270.
- TPH by USEPA Method 418.1.
- Chlorinated pesticides/PCBs by USEPA Method 8080.
- RCRA Part 264, Appendix IX total metals by USEPA Method 6010/7000 series.
- Total cyanide by USEPA Method 9010.

Analytical results indicated the presence of low concentrations of TPH (≤ 7.1 milligrams per kilogram [mg/kg]), in the upper 7 feet of soil at SWMU 1. The Technical Memorandum noted TPH contamination at SWMU 1 does not appear to be a problem. Acetone was the only VOC detected in the soil samples. The highest measured acetone concentration of 130,000 micrograms per kilogram ($\mu\text{g}/\text{kg}$) was detected in the 5- to 7-foot below land surface (bls) interval in Boring SB-5 at the southwest corner of the runways, approximately 100 feet southwest of SWMU 1. The Technical Memorandum noted acetone could not be discounted to laboratory contamination, but detected concentrations were well below the RCRA Subpart S action level in Title 40 Code of Federal Regulation (CFR) Part 264.521.

Except for beryllium, all metals concentrations were less than their respective action levels listed in RCRA Subpart S, 40 CFR Part 264.521. The Technical Memorandum noted all of the beryllium concentrations exceeded the 0.2 mg/kg action level for soil, but reported values were well within the typical range of uncontaminated soil. Furthermore, the maximum beryllium concentration of 0.71 mg/kg was less than two times (2X) the mean background reference concentration of 1.02 mg/kg, as determined from subsurface-soil samples collected at background locations during the 1995 Assembly A RFI drilling activities. Figure 3-1 presents the Assembly A background sample locations. Determination of background reference concentrations (RCs) is discussed further in Section 6.1. Soil organic and inorganic analyte data for SWMU 1 are summarized in Attachment B of the Technical Memorandum in Appendix A.

4.0 FIELD INVESTIGATIONS AND METHODOLOGY

Soil and groundwater were sampled to confirm whether contaminants were present at SWMU 1 as a result of previous drill exercises involving burning.

Specific RFI objectives were to:

- Address the potential for groundwater contamination onsite.
- Confirm the acetone detected in soil samples collected during the IM investigation.
- Collect surface-soil samples for Preliminary Risk Evaluation (PRE).

This section summarizes the field-sampling protocols employed during the RFI, which were based on the USEPA and Tennessee Department of Environment and Conservation (TDEC)-approved *Comprehensive RFI Work Plan (E/A&H, 1994b)* and *Assembly A Site Investigation Plans (E/A&H, 1994a)*. Soil and groundwater sampling performed during the RFI followed the procedures outlined in the *Comprehensive RFI Work Plan*.

The subsurface investigation at SWMU 1 consisted of Direct Push Technology (DPT) soil and groundwater sampling, while the surface investigation consisted of soil sampling with hand augers (see Section 4.5 and Appendix B for DPT survey details). Sample locations were selected to supplement the IM investigation soil borings and to determine if VOCs were present in fluvial deposits groundwater. VOCs were selected as an indicator parameter for groundwater because they were the most likely contaminant to reach groundwater, due to their mobility, and because they include constituents of potential site contaminants (solvents and petroleum). Surface soil was sampled so a PRE could be conducted to assess risk. Analytical methods and specific sampling protocols (sample handling, field Quality Assurance/Quality Control [QA/QC] and decontamination) are presented in Sections 4.1 and 4.2, respectively.

4.1 Analytical Methods

DPT subsurface soil and groundwater samples were analyzed in an onsite laboratory using USEPA Method 8021 for halogenated and aromatic VOCs only. A laboratory-quality gas chromatograph (GC) equipped with an electrolytic conductivity detector (or Hall detector) and a photoionization detector was used to perform the analyses. Level-II equivalent Data Quality Objectives (DQOs) were provided by the onsite laboratory. A minimum of 25% of DPT samples were submitted to NET Laboratory in Bedford, Massachusetts, for confirmatory VOC analysis by USEPA Method 8240 using a GC with mass spectrometer. Soil and groundwater samples analyzed by NET used Level III-equivalent DQO for 95% of the samples and Level IV-equivalent DQO for the remaining 5%.

Surface soil samples were submitted to NET for analysis using USEPA Solid Waste-846 Methods and Contract Laboratory Program reporting requirements, as listed in Table 4-1.

Table 4-1
 Analytical Parameters for Surface Soil Samples
 Chemical Characterization

Media	Parameters	SW-846 Method
Soil	TCL Volatile Organic Compounds	8240
	TCL Semivolatile Organic Compounds	8270
	TCL Chlorinated Pesticides/PCBs	8080
	Organophosphorus Pesticides	8140
	Chlorinated Herbicides	8150
	Metals (Appendix IX) and Cyanide	6010, 7080, 7421, 7841, 9012
	TPH — GRO/DRO	Tennessee Modified 8015 — GRO.BTEX/DRO
TPH	418.1	

Notes:

- TCL = Target Compound List
- GRO/DRO = Gasoline Range Organics/Diesel Range Organics
- BTEX = Benzene, toluene, ethylbenzene, and xylene

4.2 Sampling Protocols

All sampling adhered to the approved *Comprehensive RFI Work Plan* and the *Assembly A Site Investigation Plans*. See Sections 4.4.4.1 and 4.4.4.3 of the *Comprehensive RFI Work Plan* for hand auger and DPT sampling techniques. Where warranted by field conditions, all deviations from the approved procedures were appropriately documented in the field logbook.

QA/QC Samples

QA/QC samples were collected to test the level of reproducibility attainable in the sampling and analytical process, quality of equipment decontamination, quality of source waters and materials, and sample exposure to ambient contamination during handling. QA/QC samples were analyzed for the same contaminant-assessment parameters as the associated environmental samples.

DPT survey QA/QC samples, including three field blanks of deionized/organic-free water and four rinsate blanks, were collected at other SWMUs being investigated concurrently and analyzed in an onsite laboratory. No VOCs were detected in any of the blank samples. At least 25% of the samples collected were split and submitted to NET for VOC analysis to confirm the onsite laboratory results. The split-sample analytical results are included in Appendix B.

Sample Labeling

DPT samples were labeled with a seven-digit alphanumeric code that identified the site, sample type, sampling device, location, and depth. The first digit identified the site location (SWMU 1 = 1). The second digit identified the sample type collected (soil = S, groundwater = G). The third digit indicated the sampling device used (geocone = G, hydrocone = H). The fourth and fifth digits represented the sample station location (location 2 = 02). The final two digits represented the deepest point of the sample interval (5-7 feet = 07).

Examples: 1SG0107 SWMU 01/soil/geocone/location 1/7-foot depth
1GH0135 SWMU 01/groundwater/hydrocone/location 1/35-foot depth

Surface soil samples were labeled using a 10-digit sample identification number. The first three digits represented the SWMU number (SWMU 1 = 001). The fourth digit represented the matrix sampled (soil = S, soil duplicate = C). The fifth and sixth digits represented the sampling device (hand auger = HA). The seventh and eighth digits represented the sample location (hand auger boring 1 = 01). The ninth and 10th digits represented the deepest point of the sample interval (0 to 1 foot = 01).

Example: 001SHA0201 SWMU 1/soil/hand auger/location 2/1-foot depth

4.3 Data Validation

Assembly A data were validated either by E/A&H contractors CKY Environmental Services, Inc., of Torrance, California, or Validata Chemical Services of Norcross, Georgia. Validation results were described in the *Data Validation Report — Assembly A, Naval Air Station Memphis* (E/A&H, 1995). The 1996 surface-soil and stockpiled-soil data were validated by Heartland Environmental Services, Inc., of St. Charles, Missouri. All data were validated in accordance with *USEPA Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review* (USEPA, 1994a). A detailed data-validation report for the January 1996 surface soil samples is provided in Appendix C of this report.

4.4 Decontamination and Investigation-Derived Waste

Decontamination

Field equipment was decontaminated following guidelines set forth in the *Comprehensive RFI Work Plan*. All downhole equipment was decontaminated before and after use at the central decontamination pad, the N-7 aircraft wash rack.

Rinse water generated from decontamination activities was stored in a 2,000-gallon holding tank at the decontamination pad and emptied into the oil-water separator (which drains into the sanitary sewer) after a VOC scan and approval from the City of Millington's wastewater consultant, Fisher & Arnold, Inc.

Investigation-Derived Waste

No soil investigation-derived waste was generated during the RFI at SWMU 1 due to the type (i.e., DPT) of sampling conducted. Decontamination fluids generated during the RFI were bulked with those from other SWMU investigations.

4.5 DPT Soil and Groundwater Investigation — USGS and E/A&H (November to December 1995)

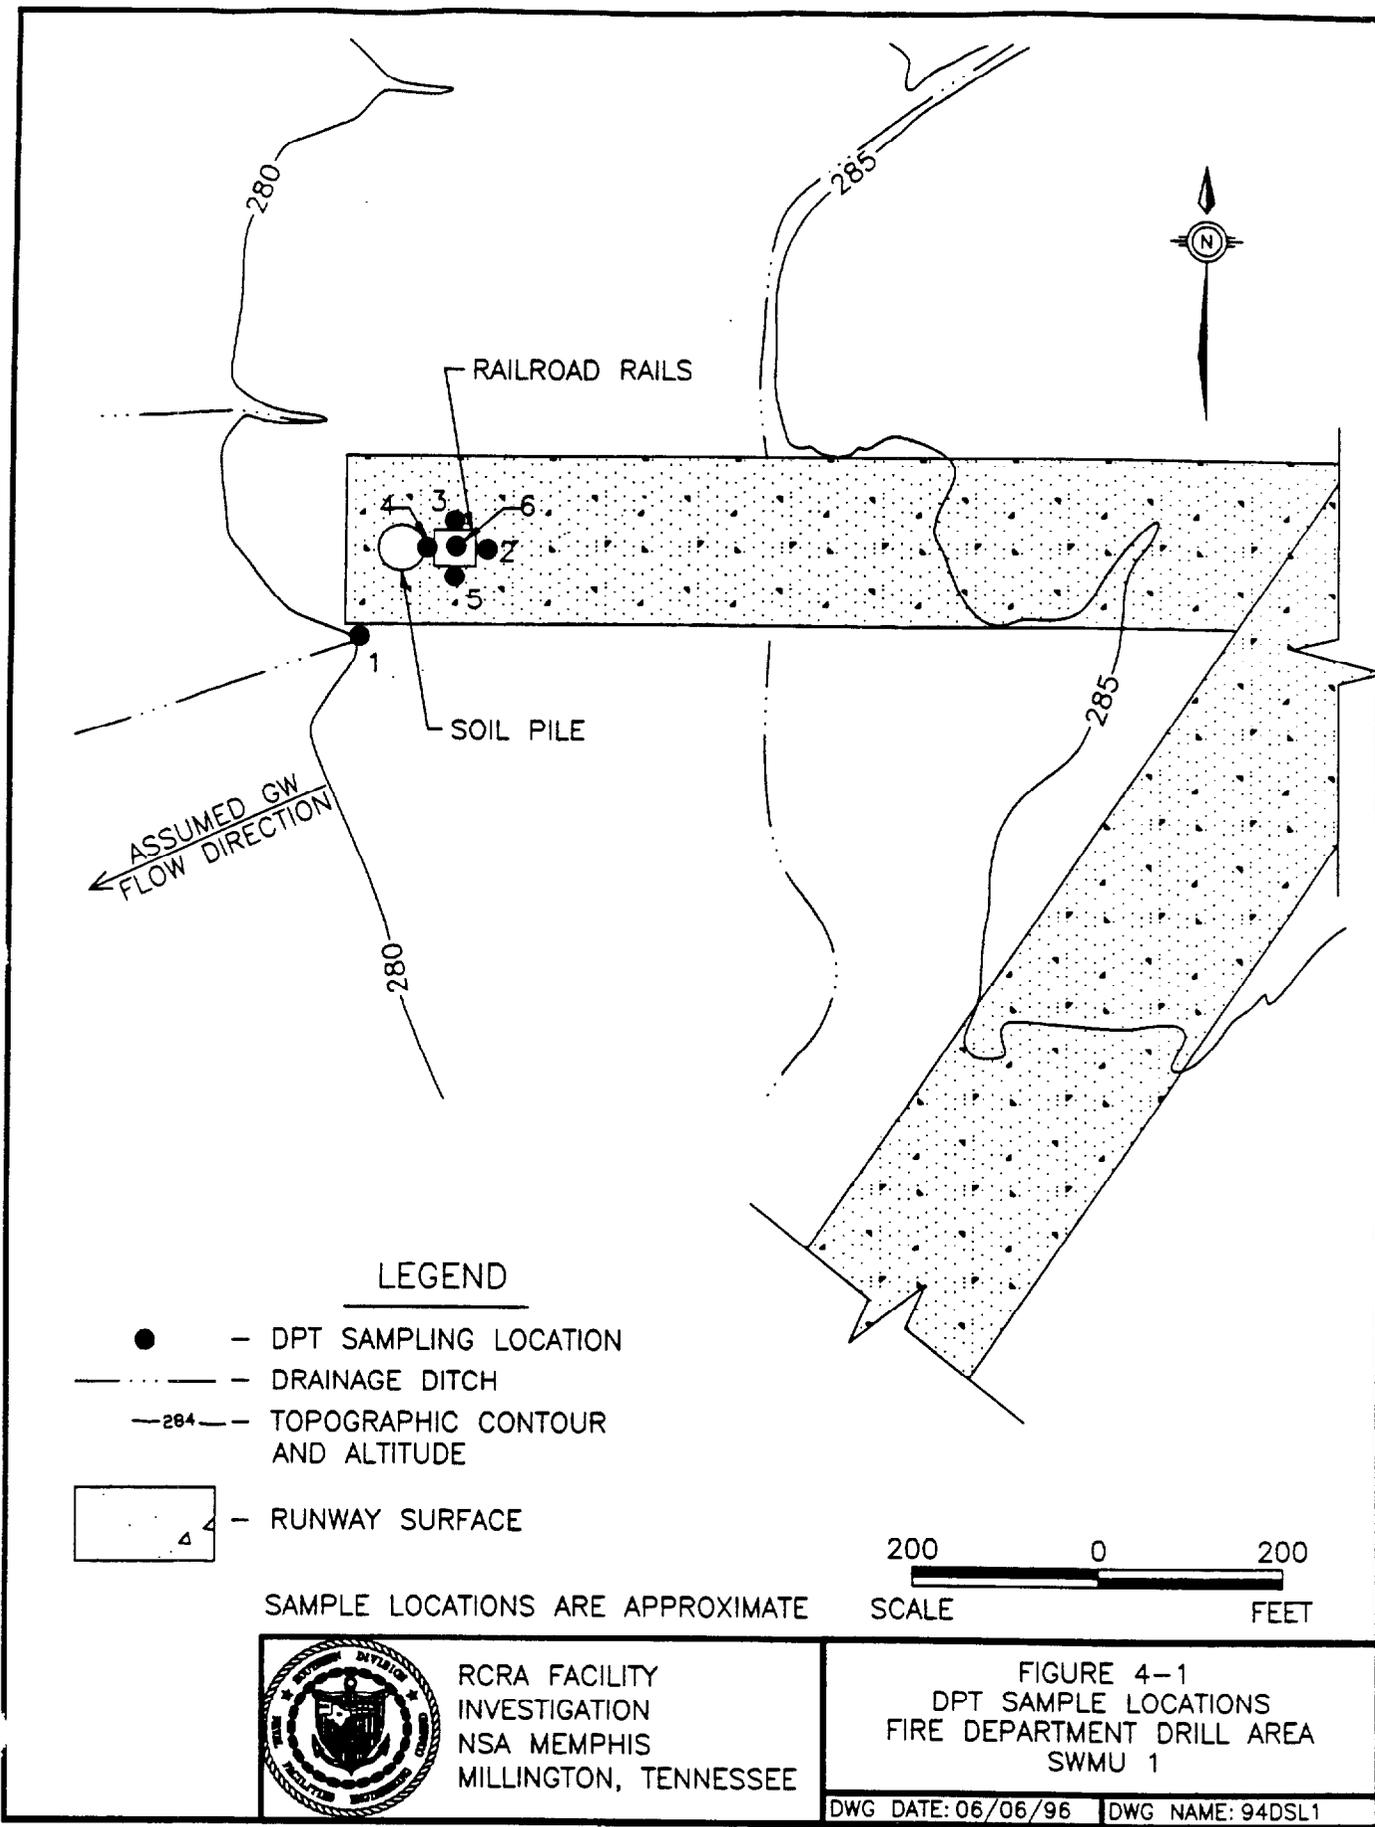

DPT sampling was conducted by Subsurface Technology of Orlando, Florida, to determine if VOC contamination was present in soil and groundwater onsite. Soil samples were collected at the six locations shown in Figure 4-1. DPT sample location 1 was selected to duplicate the IM investigation location where acetone was detected in subsurface soil. Due to the close proximity of the sample locations, groundwater samples were collected only at locations 1, 2, 3, and 5. None of the sample locations yielded shallow water, so no loess groundwater samples were collected. All groundwater samples were from the fluvial deposits. Location 1 samples were collected at two depths, 35 feet and 50 bls, in an effort to characterize the upper and lower fluvial deposits. Soil and groundwater samples were analyzed in an onsite laboratory set up by the DPT contractor. A minimum of 25% of these samples were split and submitted to NET for confirmation analyses. Analytical methods were discussed in Section 4.1. A detailed discussion of DPT survey methodologies is provided in Appendix B of this report and the results of the DPT survey are discussed in Section 6.

4.6 Surface-Soil Sampling

During the IM investigation, the first soil interval sampled was 1 to 3 feet bls, because the asphalt and gravel base prevented sample collection from the surface to 1 foot depth. As part

of the RFI, on January 31, 1996, surface soil (0 to 1 foot bls) samples were collected outside the paved areas to provide surface soil data needed for risk evaluation. Three surface soil locations were selected along the perimeter of the runway, one of which was collected in duplicate. Figure 4-2 presents the surface soil sample locations. Data generated from these samples were used to prepare a PRE in accordance with the USEPA Region IV memorandum *Guidance on Preliminary Risk Evaluations for the Purpose of Reaching a Finding of Suitability to Lease* (USEPA, 1994b). The PRE is discussed in Section 7.

4.7 Stockpiled-Soil Sampling

As previously mentioned, a soil stockpile was approximately 30 feet west of the burn area. A composite soil sample was collected on February 15, 1995, from five locations within the stockpile at depths ranging from 1 to 2 feet below the surface of the pile and submitted for analysis of VOCs, SVOCs, herbicides, pesticides, and metals. Another composite soil sample was collected on November 6, 1995, from five locations within the stockpile at depths ranging from 2 to 3 feet below the surface of the pile and submitted for Toxicity Characteristic Leaching Procedure (TCLP) analyses for VOCs, SVOCs, herbicides, pesticides, and metals. The TCLP soil sample was necessary to facilitate disposal of the stockpiled soil. The stockpiled soil was transported offsite for proper disposal as a non-hazardous, special waste in June 1996.

5.0 GEOLOGY AND HYDROGEOLOGY

5.1 Regional Geology and Hydrogeology

The general hydrogeology of the Memphis area and a conceptual model of the hydrogeology at NSA Memphis were discussed in Sections 2.11 and 2.12 respectively, of the *Comprehensive RFI Work Plan*. Updated information is available in the *Hydrogeology of Post-Wilcox Group Stratigraphic Units in the Area of the Naval Air Station Memphis, near Millington, Tennessee* (Kingsbury and Carmichael, 1995).

The two stratigraphic units investigated during the RFIs at NSA Memphis are the loess/alluvial deposits of Pleistocene and Holocene age and the underlying fluvial deposits of Pleistocene to Pliocene age. The loess — eolian deposits consisting of silt, silty clay, clay, and minor amounts of sand — is the principal unit occurring at land surface throughout the NSA Memphis Northside. Alluvium, which is restricted to stream valleys, includes alluviated or reworked loess. The loess is typically 0 to 65 feet thick in the Memphis area; at NSA Memphis it ranges from 15 to 45 feet thick. Water-bearing zones are present in the loess primarily in the upper part of this unit; however, yields are low and water quality analyses performed during previous investigations at NSA Memphis indicated that loess groundwater does not meet many primary and secondary drinking water standards. Previous investigations at NSA Memphis have found depth to water in the loess varying between 5 and 15 feet bbs and vertical hydraulic conductivities to range from 10^{-6} to 10^{-8} centimeter per second (cm/sec). Although the loess may be considered an aquitard on the basis of the relatively low hydraulic conductivities, this shallowest water-bearing zone is present within this interval. Groundwater flow in the loess is primarily downward, although locally some groundwater in the loess may discharge to nearby streams, drainage ditches, and other surface water bodies.

The fluvial deposits underlie the loess in upland areas, and consist of sand, gravel, and some clay, with thin layers of ferruginous sandstone and conglomerate at the base. This unit ranges

from 0 to 100 feet thick in the Memphis area; on the Northside of NSA Memphis it ranges from 10 to 35 feet thick and represents the most significant component of the surficial aquifer. Many shallow domestic wells in Memphis rural areas are completed in the fluvial deposits. Relative groundwater elevations between wells completed in the loess/alluvium and fluvial deposits indicate semiconfined to confined conditions in the fluvial deposits. Typically a downward vertical gradient exists between water in the loess and the fluvial deposits. Sediments in the fluvial deposits generally coarsen with depth, and typically, the upper portion consists of a mixture of very fine sand with varying degrees of silt and clay and becomes increasingly less silty with depth, grading into a fine to medium sand near the middle of the unit. Grain sizes typically coarsen below this interval, grading into a gravelly sand near the fluvial deposits basal section.

The fluvial deposits are underlain by the Cockfield Formation, a part of the Jackson-upper Claiborne confining unit, which is a heterogeneous formation consisting of very fine silty sand interbedded with clay and silt lenses or clay with interbedded fine sand lenses. The more-permeable characteristics of the fluvial deposits, compared to the relatively impermeable properties of the overlying loess/alluvium and the underlying Jackson-upper Claiborne confining unit, result in the fluvial deposits being the preferential zone of groundwater flow and the route for contaminant transport in the NSA Memphis subsurface.

5.2 Site-Specific Geology

Site geology is described briefly in the Technical Memorandum (Appendix A), summarizing the activities of the IM investigation, including logs for the borings installed. The logs from the DPT investigation are also provided in Appendix D. According to observations made during the IM investigation, the upper 44 feet beneath SWMU 1 consists of silt, clay, or a combination of these materials, and they are assumed to be of low to very low permeability. Also, the saturated zone was encountered at about 43 feet bls.

6.0 NATURE AND EXTENT OF CONTAMINATION

Contaminant risk-based concentrations (RBCs) and soil screening levels (SSLs), as listed in the *Risk-Based Concentration Table, January to June 1996* (USEPA, 1996a), were used as assessment reference values for organics and inorganics detected in soil and groundwater. Surface soil samples were compared to RBCs (residential and industrial values) while both surface and subsurface soil samples were compared to SSLs (reasonable maximum estimate of cross-media transfer from soil to groundwater). As an assessment reference for groundwater, contaminant concentrations were compared to tap water RBCs and Maximum Contaminant Levels (MCLs) from the *National Primary Drinking Water Standards* (USEPA, 1996b).

Comparison of RBCs to individual surface soil samples is consistent with current human risk models which consider contaminants in the 0 to 1-foot bls interval to pose the greatest risk to human health. SSLs, as indicated in the RBC table, should be compared to the contaminant average in each borehole, beginning at 6 inches bls and ending at the termination of the borehole. To simplify the comparison of SSLs to contaminants, and since data collected during this RFI did not begin at 6 inches bls, the maximum concentration of each detected contaminant will be compared to the SSL value, rather than the borehole average. Any individual contaminant exceeding both the SSL values and RCs will be evaluated in the fate and transport discussion (Section 9).

The background criteria are discussed briefly in Section 6.1. Section 6.2 summarizes the contaminants detected in soil at SWMU 1, from the IM investigation and this RFI, and their respective RBC and/or SSL values. Section 6.3 provides a discussion of the stockpiled soil samples analytical results. Section 6.4 summarizes the contaminants detected in groundwater. The nature and extent of contaminants detected at SWMU 1 are summarized in Section 6.5, which includes concentrations in soil exceeding the RBCs and RCs, or exceeding the SSL for transfer from soil to groundwater, or contaminants in groundwater exceeding the RBCs and/or

MCLs. Contaminants identified in soil and groundwater are further evaluated in the PRE assessment, ecological risk assessment, and fate and transport discussion (Sections 7, 8, and 9, respectively).

6.1 Background Reference Concentrations

Background locations were established at five areas at NSA Memphis (shown in Figure 3-1) to assess ambient soil and groundwater quality conditions. Background data for soil consist of 12 samples collected from five borings, while groundwater data were collected from monitoring well clusters at four of the five boring locations. Background monitoring wells were not installed at location BG-3, near the horse stables on the NSA Memphis Northside, because of the absence of groundwater in the loess and the unexpected thinness of the fluvial deposits in this area. The well clusters consist of three monitoring wells screening three depth intervals — one screened in the uppermost saturated zone in the loess, one screened in the uppermost part of the fluvial deposits, and one screened in the lower section of the fluvial deposits. The background reference concentrations and the methodologies used to calculate them are outlined in a technical memorandum included as Appendix E.

6.2 Soil Analytical Results

Soil samples collected during the 1992 IM investigation included analyses for VOCs, TPH (by GC/FID), cadmium, chromium, and lead, with the soil samples from three locations (Borings 5, 11, and the background boring) undergoing additional analyses for SVOCs, cyanide, pesticides/PCBs, TPH (by USEPA Method 418.1), and Appendix IX metals. The 1995 RFI DPT survey (see Section 4.5) included analysis of soil samples for VOCs only, with VOCs detected in two of six DPT sample locations. Surface soil samples (0 to 1 foot bls) collected in January 1996 were analyzed for VOCs, SVOCs, herbicides, pesticides/PCBs, Appendix IX metals, and TPH — Gasoline Range Organics (GRO) and Diesel Range Organics (DRO). The surface soil samples indicated detectable concentrations of VOCs, pesticides, and metals. Each

contaminant group is discussed below, including those exceeding RBCs, SSLs, and/or RCs for inorganics.

Volatile Organic Compounds

VOCs were detected in the three surface soil samples collected during the RFI at SWMU 1. All reported concentrations in surface soil samples were less than their respective RBCs and the maximum concentration of each VOC detected was less than its respective SSL.

VOCs were detected in four of 28 IM investigation soil samples, two of which were background samples. IM Boring 5, south of the southwest corner of the paved airstrip (see Figure TM-2 in Appendix A), exhibited acetone concentrations of 36,000 $\mu\text{g}/\text{kg}$ and 130,000 $\mu\text{g}/\text{kg}$ in samples from 1 to 3 feet and from 5 to 7 feet bls, respectively. Both acetone concentrations detected in Boring 5 exceeded the acetone SSL of 8,000 $\mu\text{g}/\text{kg}$. The two soil samples from the IM background boring location, approximately 800 feet west of Boring 5, also contained low (<1 mg/kg) concentrations of acetone and both detectable amounts were below acetone's SSL.

All onsite laboratory results for soil samples collected during the DPT survey were nondetect for VOCs. Offsite laboratory analysis of split soil samples (1SG0107 and 1SG0112) from DPT sample location 1, selected to confirm the acetone "hit" during the IM investigation in Boring 5, exhibited low (<1 mg/kg) concentrations of acetone, 2-butanone, and toluene. Analysis of the other split DPT boring split sample (1SG0607), from location 6, also exhibited low (<1 mg/kg) concentrations of acetone and toluene. All reported VOC concentrations from the DPT survey soil samples analyzed offsite were less than their respective RBCs and the maximum concentration of each VOC detected was less than its respective SSL. There is no SSL available for 2-butanone; however, 2-butanone and acetone are common laboratory artifacts and the low concentrations indicate both may have been introduced into the sample at the

laboratory. VOC results for surface and subsurface soil samples are presented in Tables 6-1 and 6-2, respectively.

Semivolatile Organic Compounds

No SVOCs were detected in the soil samples collected from SWMU 1.

Total Petroleum Hydrocarbons

The three surface-soil samples collected during the RFI were analyzed for TPH-GRO and TPH-DRO. Detectable concentrations of TPH-GRO were exhibited in samples 001SHA0201 and 001SHA0301, while TPH-DRO was exhibited in sample 001SHA0301 (390 mg/kg). During the IM investigation TPH was analyzed by Method 418.1 and detectable concentrations ranged from 4.1 mg/kg to 7.1 mg/kg. The highest concentration was detected in the 0 to 1-foot sample interval of Boring 01-B-10 along the centerline of the airstrip (see Figure TM-2 in Appendix A).

The TDEC Division of Solid Waste Management, State Remediation Section, has issued an interim policy statement establishing TPH guidelines for petroleum sites that are not associated with regulated underground storage tanks. TDEC's recommended TPH concentration for determination of no further action at these sites is 100 mg/kg. Only one of the three surface soil samples collected during the RFI exceeded this concentration, sample 001SHA0301. These surface soil samples were collected within approximately 2 feet of the asphalt runway. The one isolated, elevated TPH-DRO concentration may have resulted from fuel used during training exercises being carried off the pavement by rainwater, or from the asphalt itself. Tables 6-3 and 6-4 present the results for TPH analyses for surface and subsurface soil samples.

Herbicides in Soil

No herbicides were detected in the soil samples collected from SWMU 1.

Organophosphorus Pesticides and Chlorinated Pesticides/PCBs in Soil

No chlorinated pesticides or PCBs were detected in the two IM investigation soil borings designated for full-scan analysis and these samples were not analyzed for organophosphorus pesticides. However, dieldrin, technical chlordane and isomers, DDT, heptachlor epoxide, and methoxychlor were detected in all three RFI surface soil samples. All detected compounds, except dieldrin, exhibited concentrations less than the residential and industrial RBCs. Dieldrin, detected in all three surface soil samples, exceeded its residential RBC and SSL, but only one sample (001SHA0101) exceeded the industrial RBC. Pesticide/PCB results for surface soil samples are presented in Table 6-5.

- J = Estimated concentration
- ND = Compound was not detected
- NA = Not available

The June 2, 1995, Technical Memorandum *Discussion of Dieldrin Risk Management Issues*, has been included in this RFI report as Appendix F. In summary, the memorandum stated that dieldrin was ubiquitous at NSA Memphis as a result of aerial applications during a U.S. Department of Agriculture (USDA) quarantine on the white-fringed beetle during the 1950s and 1960s. Dieldrin was also used in the pest-control trade along with chlordane for general subterranean termite control. Risk estimates based on the soil dieldrin concentrations reported at NSA Memphis did not exceed 1E-4 Incremental Excess Lifetime Cancer Risk (ILCR). As stated in the memorandum, "This finding indicates that dieldrin levels found at each SWMU do not necessitate remedial action in the absence of other significant carcinogenic risk contributors." The maximum dieldrin concentration at SWMU 1 was greater than the corresponding industrial RBC and was greater than background concentrations listed in the memorandum. As a result,

dieldrin at SWMU 1 was further assessed; however, no cumulative ILCR was estimated to exceed $1E-4$ for any one receptor group and, therefore, dieldrin was not identified as a contaminant of concern at SWMU 1.

Metals and Cyanide in Soil

In the RFI surface soil samples, no metals concentrations were detected exceeding both their respective RBCs or SSLs and their RCs. All metals detected, except for arsenic, were less than their respective residential RBCs. Arsenic exceeded both residential and industrial RBCs, but it did not exceed its RC of 13.2 mg/kg. The maximum detected concentration of barium was the only metal exceeding its respective SSL, but no individual barium concentration exceeded the RC. Beryllium was not detected in any of the surface soil samples. Detected metals concentrations for surface soil are presented in Table 6-6.

Results of the subsurface soil samples collected during the IM investigation indicated no metals were detected in excess of both their respective SSLs and 2X mean background concentrations. Barium was detected in seven samples above its SSL, but none of the individual concentrations exceeded barium's RC of 289 mg/kg. Metals detected in subsurface soil are listed in Table 6-7. Cyanide was not detected in the soil samples.

	Copper	10.8
	Lead	380 J
	Nickel	10
	Vanadium	18.2
	Zinc	97.9
Petroleum Hydrocarbons (mg/kg)	TPH (USEPA Method 418.1)	1300

Notes:

- J = Estimated concentration
- D = Diluted sample
- $\mu\text{g}/\text{kg}$ = micrograms per kilogram
- mg/kg = milligrams per kilogram

In order to dispose of the stockpiled soil, another composite soil sample collected in November 1995 was submitted for full TCLP analysis. Except for barium, results for the TCLP analyses were less than detection limits. Barium had a reported TCLP concentration of 0.92 milligrams per liter (mg/L), which is less than the 100 mg/L TCLP limit. Analytical results for both stockpiled soil samples are included in Appendix G.

6.4 Groundwater Analytical Results

No monitoring wells have been installed at SWMU 1; however, fluvial deposits groundwater samples were collected at SWMU 1 during the DPT investigation. Five groundwater samples, two from sample location 1 and one each from locations 2, 3, and 5, were analyzed in an onsite laboratory for VOCs. No VOCs were detected in any of the groundwater samples analyzed onsite. Split samples from locations 1 and 2, sent to an offsite laboratory, exhibited low concentrations ($< 15 \mu\text{g}/\text{kg}$) of acetone and carbon disulfide, whose tap water RBCs are 3,700 $\mu\text{g}/\text{kg}$ and 1,000 $\mu\text{g}/\text{kg}$, respectively.

6.5 Summary of Nature and Extent

Soil analytical results indicate contamination at SWMU 1 is present in isolated areas only. Low VOC concentrations were detected in soil samples collected during the IM and RFI; however, the results were less than RBCs and SSLs. Dieldrin was the only pesticide detected in soil above RBCs and SSLs. As stated in Section 6.2, dieldrin is ubiquitous at NSA Memphis as a result of aerial applications conducted during the 1950s and 1960s due to a USDA quarantine of the white-fringed beetle. A TPH-DRO concentration of 390 mg/kg was detected in surface soil sample 001SHA0301, exceeding the TDEC TPH action level of 100 mg/kg. No metals concentrations in soil exceeded both their RBCs or SSLs and their RC.

7.0 PRELIMINARY RISK EVALUATION

In accordance with *Guidance on Preliminary Risk Evaluations for the Purpose of Reaching a Finding of Suitability to Lease* (USEPA, 1994b), a PRE was conducted for SWMU 1 using data from the three surface-soil samples collected in January 1996 during the RFI. A PRE is conducted by constructing a table for carcinogenic and systemic (noncarcinogenic) compounds. The maximum concentration for each detected constituent and corresponding RBC concentration is entered into the table to calculate cumulative human-health risk. Soil data used in the calculations are exclusively from the samples collected across the 0- to 1-foot bls interval. Proportionate risk is calculated for each detected site constituent by comparing the maximum reported concentration with its respective RBC value. Separate calculations were performed for both residential and industrial scenarios. RBC values were calculated by USEPA based on a risk threshold of 10^{-6} for carcinogens or a hazard quotient (HQ) threshold of 1.0 for noncarcinogens. Therefore, a risk ratio is calculated for each contaminant by the following equations:

Carcinogenic Risk Ratio:

$$RR = \frac{\text{Media Concentration}}{\text{Screening Value}} \times TR$$

Noncarcinogenic Risk Ratio:

$$RR = \frac{\text{Media Concentration}}{\text{Screening Value}} \times THQ$$

where:

RR	=	risk ratio
Media Concentration	=	maximum concentration of a site constituent
Screening Value	=	RBC value for that particular constituent
TR	=	target risk for RBCs
THQ	=	target HQ for RBCs

The risk ratios for each constituent are summed separately for both residential and industrial scenarios to determine the overall risk associated with the site. If the carcinogenic ILCR is greater than 10^{-4} or the noncarcinogenic hazard index (HI) is greater than 1, the site may require additional investigation for the corresponding land-use scenario. If neither threshold is exceeded, no further action is recommended and the property is considered suitable to lease with respect to identified contaminants. Tables 7-1 and 7-2 summarize PRE results for SWMU 1 for carcinogens and noncarcinogens, respectively.

The resulting risk sums for carcinogens were 2×10^{-5} for residential and 3×10^{-6} for industrial soil. These are well below the carcinogenic ILCR of 10^{-4} .

Table 7-1
 Preliminary Risk Evaluation — Carcinogens
 Fire Department Drill Area — SWMU 1
 (in micrograms per kilogram)

Chemical	Screening Value			Risk Ratio	
	Media Conc.	Residential	Industrial	Residential	Industrial
	Soil	Soil	Soil	Soil	Soil
Chlordane	230	4.90e+02	4.40e+03	4.69e-07	5.23e-08
Dieldrin	470	4.00e+01	3.60e+02	1.18e-05	1.31e-06

Toluene	2	1.6e+07	4.1e+08	1.25e-07	4.88e-09
Xylene	20	1.6e+08	1.0e+09	1.25e-07	2.00e-08
Methoxychlor	100	3.9e+05	1.0e+07	2.56e-04	1.00e-05
Barium	81,800	5.5e+06	1.4e+08	1.49e-02	5.84e-04
Cadmium	2,000	3.9e+04	1.0e+06	5.13e-02	2.00e-03
Chromium	15,000	7.8e+07	1.0e+09	1.92e-04	1.50e-05
Cobalt	6,600	4.7e+06	1.2e+08	1.40e-03	5.50e-05
Copper	11,700	3.1e+06	8.2e+07	3.77e-03	1.43e-04
Nickel (soluble salts)	12,000	1.6e+06	4.1e+07	7.50e-03	2.93e-04
Tin	14,900	4.7e+07	1.0e+09	3.17e-04	1.49e-05
Vanadium	19,400	5.5e+05	1.4e+07	3.53e-02	1.39e-03
Zinc	53,800	2.3e+07	6.1e+08	2.34e-03	8.82e-05
Risk Sum				0.3	0.01

Notes:

The highest reported concentration for each contaminant, including the duplicate sample, was used to develop Table 7-2. Soil sample data used were collected from the surface (0 - 1 foot) interval only. Screening values (RBCs) are from the January to June 1996 RBC Table (USEPA, 1996a).

The resulting risk sums for noncarcinogens were 0.3 for residential soil and 0.01 for industrial soil. Both are well below the established risk criterion of 1.

Lead and TPH do not have RBC values and were therefore not included in the PRE. Lead was detected at a maximum concentration of 83.9 mg/kg in surface soil, much less than the 400 mg/kg residential soil cleanup level for total lead (USEPA, 1994c). The maximum reported TPH-DRO concentration was 390 mg/kg. Currently, there is no established method for calculating risk for TPH. However, many of the individual compounds that make up TPH have RBCs, which are included in PRE calculations.

Conclusions and Recommendations

Based on the information gathered during this investigation, the following conclusions and recommendations have been reached:

- SWMU 1 can be developed for industrial/commercial use.
- VOCs, TPH, pesticides, and metals were detected in the three RFI surface soil samples collected from the 0 to 1-foot bls interval in January 1996.
- Maximum reported concentrations of all detected compounds in surface soil were less than either their respective residential and industrial RBCs or their respective RCs.
- Based on the PRE performed on data from samples collected from 0 to 1 foot bls:
 - Carcinogens: Site contaminants did not exceed the 10^{-4} risk threshold for residential or industrial scenarios, indicating suitability for lease for either residential or industrial land use.

- Noncarcinogens: Site contaminants did not exceed the HI of 1 for residential or industrial scenarios, indicating suitability for lease for either residential or industrial land use.

8.0 ECOLOGICAL RISK ASSESSMENT

An ecological risk assessment (ERA) was conducted to develop a qualitative and/or quantitative ecological appraisal of the actual or potential effects on the ecosystem from contamination identified at SWMU 1. The assessment considers environmental media and exposure pathways that could result in unacceptable levels of exposure to flora and fauna now or in the foreseeable future. The approach to assessing risk components at SWMU 1 was based on *Ecological Risk Assessment — Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (USEPA, September 1994d), *Risk Assessment Guidance for Superfund, Volume II — Environmental Evaluation Manual* (USEPA, 1989), and *Framework for Ecological Risk Assessment* (USEPA, 1992).

8.1 Problem Formulation

Environmental Setting

SWMU 1 is an approximately 1.5-acre area which includes the west end of inactive Runway 09 and the surrounding agricultural area. No significant habitat features are present which could provide shelter, substantive food or water, or a mixture of cover types to wildlife. This absence of habitat, thus receptors, limits the potential for ecological risk.

Preliminary Risk Characterization

The Phase II Contamination Assessment of the ERA was conducted by reviewing the January 1996 results of surface soil from three sampling locations, along with reviewing previous investigations. The analytical results for these three samples are presented in Section 6.

Dieldrin was detected in surface soil. However, as stated in Section 6.2, it has been determined that dieldrin concentrations detected at SWMU 1 do not necessitate remedial action in the absence of other significant carcinogenic risk contributors. No cumulative ILCR was estimated

to exceed IE-4 for any one receptor group and, therefore, dieldrin was not identified as a contaminant of concern at SWMU 1.

TPH-DRO was detected at a concentration of 390 mg/kg in the 0 to 1-foot sample from Boring 001SAH03. Because no other organics were detected at concentrations above action levels, and the occurrence of TPH was isolated, it does not pose a threat.

All inorganic parameters were less than their respective RCs and appear to represent ambient conditions.

8.2 Risk Summary

Although concentrations of some contaminants were greater than concentrations that would indicate risk to certain terrestrial groups, the absence of natural habitat features in the vicinity of the SWMU makes exposure unlikely.

9.0 FATE AND TRANSPORT

As discussed in Section 6, the 1992 IM investigation included analyses for VOCs, TPH, cadmium, chromium, and lead, with additional analyses for SVOCs, cyanide, pesticides/PCBs, and Appendix IX metals at three locations. The 1995 RFI DPT survey analyzed soil and groundwater samples for VOCs only. The 1996 RFI surface soil samples were analyzed for VOCs, SVOCs, herbicides, pesticides/PCBs, Appendix IX metals, and TPH-GRO/DRO.

All soil samples analyzed for VOCs during the above mentioned investigations contained concentrations that were less than RBCs and SSLs; therefore, fate and transport of VOCs do not warrant further discussion. No SVOCs were detected onsite; therefore, fate and transport of SVOCs will not be discussed.

Only one of the three 1996 surface-soil samples analyzed for TPH exceeded the TDEC Division of Solid Waste Management, State Remediation Section action level of 100 mg/kg. This isolated occurrence of TPH-DRO could possibly be due to asphalt, as the sample was collected approximately 2 feet from an asphalt runway. Fate and transport of TPH will not be discussed since the occurrence was isolated and may not be due to site activities.

Dieldrin was the only pesticide detected in concentrations exceeding SSLs and RBCs. The June 2, 1995, Technical Memorandum, *Discussion of Dieldrin Risk Management Issues* (Appendix F), states that dieldrin is ubiquitous across NSA Memphis as a result of aerial applications in the 1950s and 1960s; therefore, fate and transport of dieldrin is not discussed.

Barium was the only metal detected above its SSL; however, its maximum concentration did not exceed its RC. Hence, barium should warrant no further discussion.

*RCRA Facility Investigation Report
NSA Memphis — Assembly A
Fire Department Drill Area — SWMU 1
Revision: 1
September 18, 1996*

This page intentionally left blank.

10.0 CONCLUSIONS AND RECOMMENDATIONS

Site contaminant concentrations, with the exception of dieldrin, were less than both their corresponding RBCs or SSLs and their RCs. As described in the June 2, 1995 Technical Memorandum, *Discussion of Dieldrin Risk Management Issues*, dieldrin is ubiquitous at NSA Memphis as a result of past aerial applications in response to a USDA quarantine of the white-fringed beetle. One surface-soil sample exhibited a TPH concentration exceeding the TDEC TPH action level of 100 mg/kg; however, this was an isolated occurrence.

Based on the information gathered during this and previous investigations, and the PRE conducted for SWMU 1, risk to human health and the environment associated with the contaminants detected in the surface soil should be minimal. As presented in the PRE, the carcinogenic ICLR was below 10^{-4} and the noncarcinogenic HI was less than 1. No further action is recommended for SWMU 1.

SUBJECT: NAS Memphis RFI — Interim Measures Field and Analytical
Summary for SWMU 1

DATE: March 1, 1993

INTRODUCTION

To expedite a proposed lease of NAS Memphis (NASMEM) property to the city of Millington, an Interim Measures investigation was recently conducted at SWMU 1 (Fire Department Drill Area [FDDA]), an area immediately west of the existing NASMEM aircraft landing strip. The tract of land proposed for lease would be developed into a municipal light-aircraft landing strip by the city.

More extensive characterization will take place at this SWMU during the full RCRA Facility Investigation (RFI) scheduled to begin later this year. The Interim Measures investigation was conducted before the RFI characterization to determine if fire fighting training activities conducted at the FDDA have resulted in soil contamination, and if so, to determine whether corrective measures should be implemented before leasing the land. The northern end of the tract of land under consideration encompasses the western edge of an abandoned runway used by the NASMEM fire department for training until 1981. See Figure TM-1 in Attachment A for details.

FIELD WORK SUMMARY

Field work was conducted from October 26 until November 6, 1992 by the U.S. Geological Survey (USGS). The work included the drilling of 12 shallow soil borings less than 15 feet deep. One background boring was also drilled at a location about 1,000 feet southwest of the site (Attachment A, Figures TM-1 and TM-2). The boring locations were originally proposed at selected stations where soil gas samples were collected in May 1991, so that a possible correlation could be drawn between soil gas analytical results and concentrations of contaminants in soil samples. However, the locations of several borings were adjusted because of wet soil conditions and to avoid damaging the cotton crop growing in fields surrounding the FDDA. The locations of all soil borings are shown in Figure TM-2 in Attachment A. The plan for collecting boring samples at the surface and at 5-foot increments until reaching the water table also required adjustment because the water table was encountered at a much greater depth than expected (43 feet below land surface).

Two subsurface soil samples (1-3 and 5-7 feet below land surface) were collected from Borings #1 through #10 at the FDDA and from the boring at the background location. Three subsurface soil samples (1-3, 5-7, 10-12 feet below land surface) were collected from Boring #11 and Boring #12. A third, deeper interval was sampled at these two locations because of their proximity to the actual area where the training operations were conducted.

Samples were collected using the procedures described in Sections 2.2 and 4.5 of the Interim Measures Work Plan for SWMUs 4 and 5, except that all borings were advanced to about 1 foot below land surface without sampling to avoid collecting asphalt and fill materials (mainly gravel) in the upper few inches beneath and adjacent to the runway. Samples from the background boring were collected using the same procedures for consistency, even though pavement or fill materials were not present at that location.

ANALYTICAL QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

In all, 35 solid-phase environmental samples were collected, including 28 subsurface soil samples, three soil duplicates, two soil matrix spike samples, and two soil matrix spike duplicate samples. All samples were shipped under chain-of-custody by overnight carrier to the Enseco-Rocky Mountain Analytical Laboratory (RMAL) in Arvada, Colorado. All samples, except those from Boring #5, Boring #12, and the background boring, were analyzed for the following parameters:

- Aromatic Volatile Organic Compounds (EPA Method 8020)
- Total Petroleum Hydrocarbons (GC/FID)
- Total Cadmium, Chromium, and Lead (EPA Methods 7130, 7190, and 7421)

The selection of these parameters was based on the potential contaminants of concern described for the site in the Draft RFI Work Plan (May 1990). Samples from Boring #5, Boring #12, and the background boring (and their associated QC samples) were analyzed for the following RFI parameters:

- Volatile Organic Compounds (EPA Method 8240)
- Semivolatile Organic Compounds (EPA Method 8270)
- Total Petroleum Hydrocarbons (EPA Method 418.1)
- Total Cyanide (EPA Method 9010)
- Organochlorine Pesticides/PCBs (EPA Method 8080)
- RCRA Part 264, Appendix IX Metals (EPA Method 6010/7000 series)

These parameters are identical to those used for the Interim Measures investigation for SWMUs 4 and 5. They were selected to document the presence or absence of unexpected soil contaminants at the FDDA.

Quality assurance/quality control protocols identical to those utilized for the Interim Measures investigation for SWMUs 4 and 5 were adhered to throughout the sampling program. In addition to the solid-phase samples listed above, QA/QC included the collection of field blanks of potable, deionized/organic-free, and equipment-rinsate water (one set each day for a total of five sets), and inclusion of a trip blank for volatile organics (8020 or 8240) analysis in each of the 11 coolers used to ship samples to the laboratory. All expendable field sampling supplies (i.e., bottles, preservatives, labels, chain-of-custody forms, and trip blanks) used in the investigation were supplied by RMAL.

Potable and deionized/organic-free water for field blanks were obtained from the NASMEM public water system and the Memphis Subdistrict Office of the USGS, respectively. All pertinent data from the field investigation were recorded in a bound field logbook, or on boring logs and specially designed forms for recording field equipment calibration and measurement data.

FIELD OBSERVATIONS

Lithological observations made during the investigation show that materials in the upper 44 feet (total depth of the test boring) beneath the study area consist primarily of silt, clay, or a combination of these materials, and on the basis of visual qualification in the field, are assumed to be of low to very low permeability. The saturated zone was encountered at about 43 feet below land surface. A 20-foot rise in water level was observed in the test boring after it was left standing open overnight. The apparent rise in water level may have resulted from a combination of collapse of the hole to about 29 feet below land surface, runoff entering the open hole from rainfall which occurred overnight, and confined aquifer conditions.

DATA SUMMARIES

Tables TM-1 through TM-3 (Attachment B) summarize validated positive results for total petroleum hydrocarbons by GC/FID, volatile organic compounds, and total metals analytical data, respectively. Aromatic volatile organic compounds, semivolatile organic compounds, total petroleum hydrocarbons by IR, pesticides, and total cyanide were not detected above reporting limits.

Table TM-1 indicates the presence of TPH (GC/FID) at concentrations just above the 4 mg/kg reporting limit in the first two sampling intervals of five borings. TPH results for all samples analyzed by Method 418.1 (IR) were below the 20 mg/kg reporting limit. Based on the sampling conducted at the FDDA, TPH contamination does not appear to be a problem at this site.

Acetone was the only volatile organic compound with validated positive results reported for the soil samples (Table TM-2). It was detected in Boring #5 (36 mg/kg at 1-3 feet and 130 mg/kg at 5-7 feet) and in the background boring (0.18 mg/kg at 1-3 feet and 0.20 mg/kg at 5-7 feet). Acetone is a common laboratory contaminant and was detected at a concentration of 2.9 ppb in the blank associated with these samples. Because the acetone concentration was so low in the blank and was in the parts per million range for the soil samples, it cannot be discounted as laboratory contamination using the 5x or 10x rules for blanks found in the Contract Laboratory Program Data Validation Guidelines. However, acetone was detected in only one boring at the FDDA at a concentration well below the RCRA Subpart S action level in 40 CFR Part 264.521(a)(2)(i-iv) and was not detected at the deepest interval sampled in that boring.

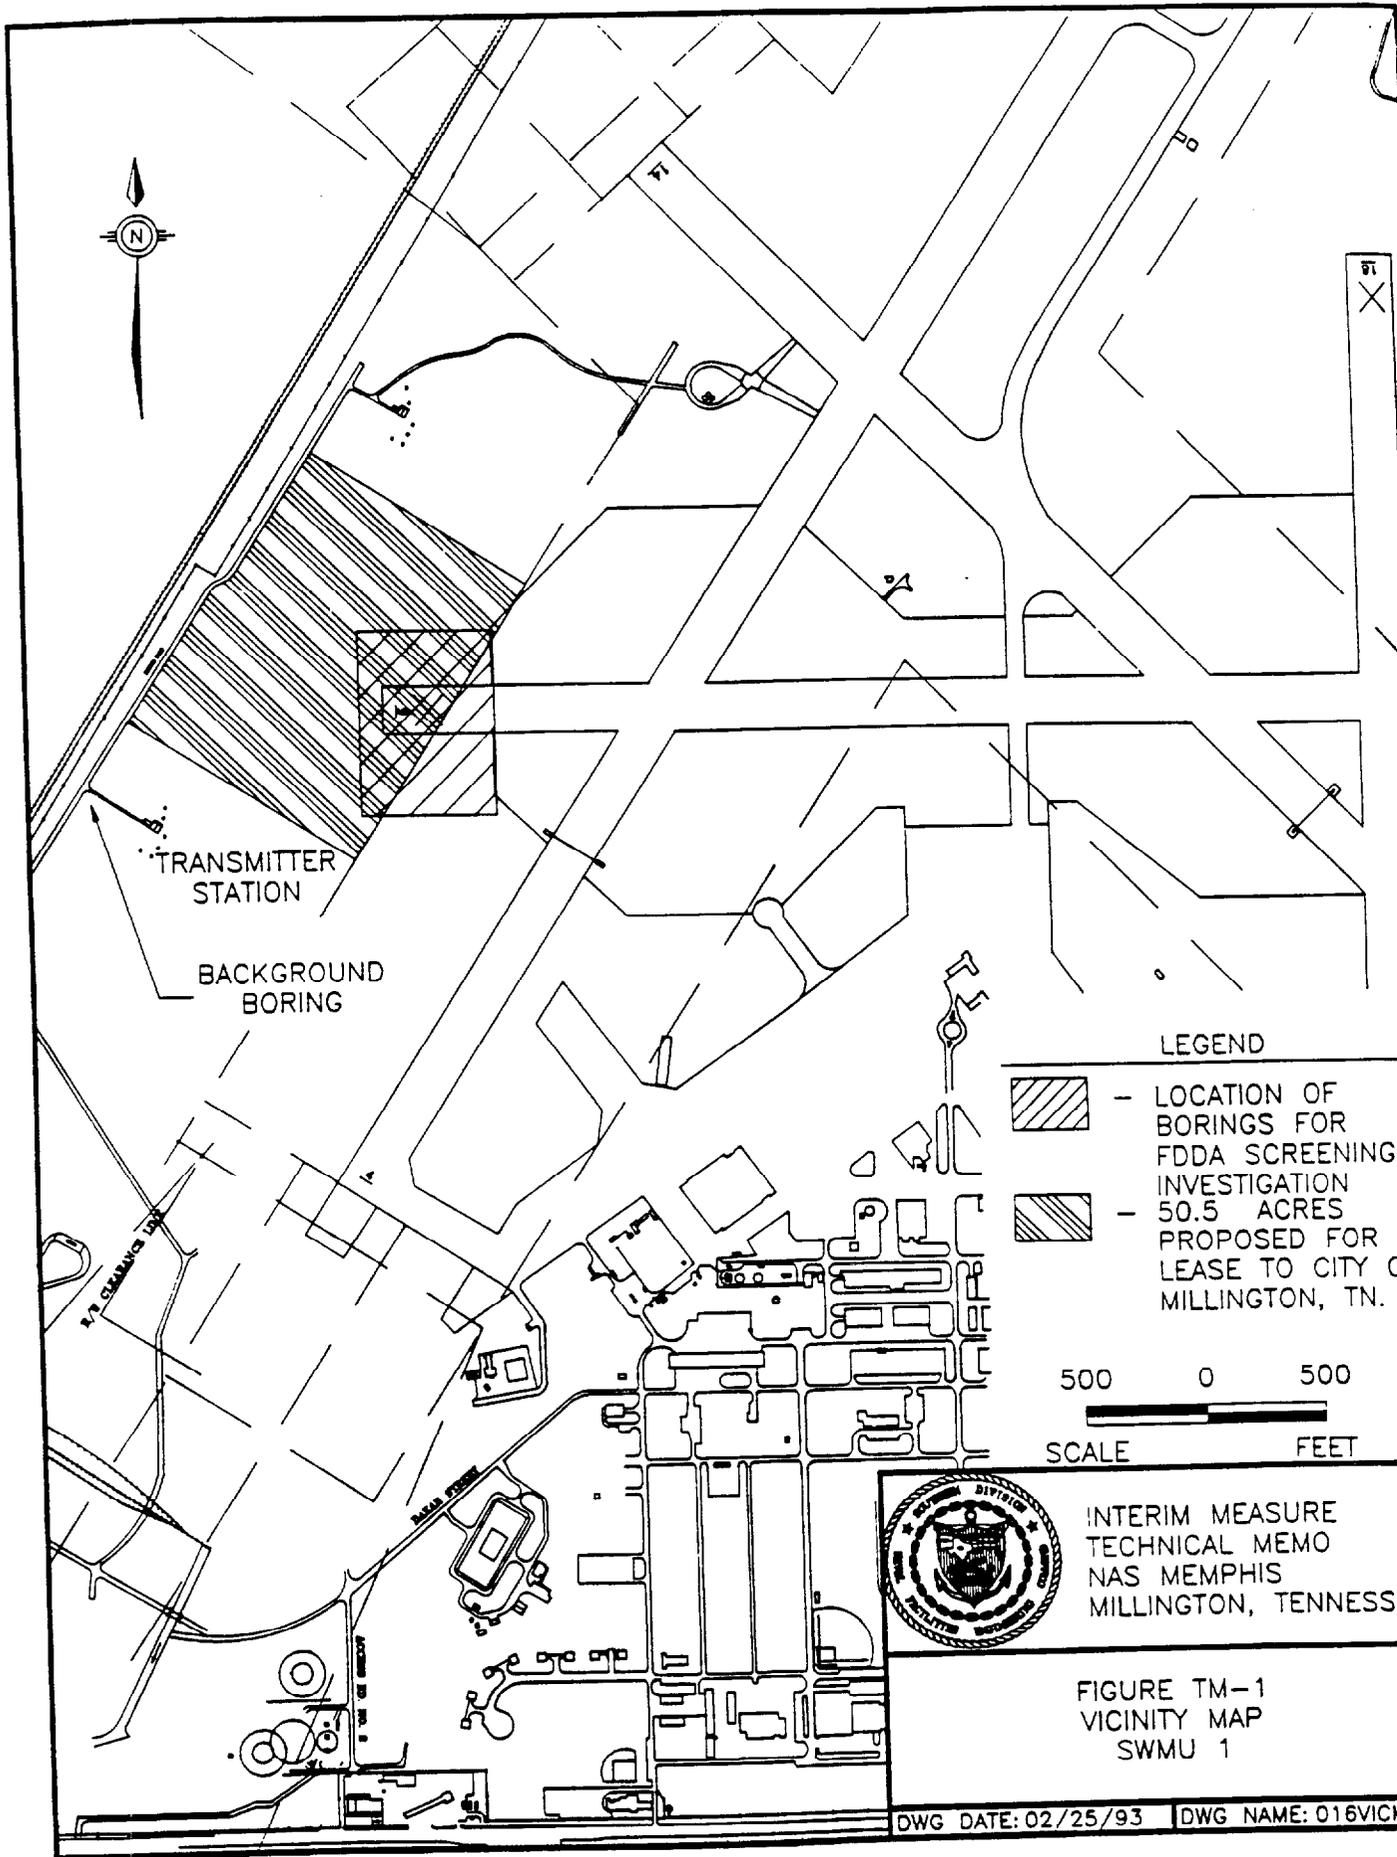

Results of inorganic analyses for total metals are summarized in Table TM-3. In general, results for samples from Boring #5 were slightly above those from the background boring (samples with "BG" in the identifier). However, a literature search indicates that the values for all samples are within the range of typical concentrations found in uncontaminated soils. The metals values were also compared to the RCRA Subpart S action levels in 40 CFR Part 264.521(a)(2)(i-iv). With the exception of beryllium, all values were well below their respective action levels. All of the beryllium values exceeded the 0.2 mg/kg action level for soil. Naturally occurring levels of beryllium could easily exceed the current action level. The beryllium values reported for the Interim Measure samples were 0.71 mg/kg or less which is well within the typical range of 0 to 5 mg/kg beryllium found in uncontaminated soils (*Criteria for Contaminated Soil/Sediment Cleanup*, J. Fitchko, 1989). Soil samples from the Interim Measures investigation at SWMUs 4 and 5 had similar beryllium concentrations. Therefore, the beryllium that was reported for samples from SWMU 1 is believed to be naturally occurring.

CONCLUSIONS AND RECOMMENDATIONS

Based on the data generated by the Interim Measures investigation at SWMU 1, SOUTHDIIV does not feel that leasing the land south of this area will expose construction workers or the public to adverse health risks. Therefore, SOUTHDIIV recommends that no further action be required in the Interim Measures investigation area for SWMU 1 and that all data generated under this investigation be cataloged as supplemental data for use in the RFI. Corrective measures, if any, should be included with those for the entire site following complete RFI characterization.

Appendix B
DPT Survey Summary

ASSEMBLY A DPT SURVEY SUMMARY

The DPT survey for Assembly A solid waste management units (SWMUs) was conducted between Monday, November 14 and Wednesday, December 21. Soil and groundwater samples collected at each SWMU were analyzed at a mobile laboratory set up by the DPT subcontractor. The samples were analyzed according to EPA Method 8021 (halogenated and aromatic volatile organic compounds) using a gas chromatograph with an electrolytic conductivity detector and a photoionization detector (GC/ELCD/PID). The ELCD, also known as a Hall detector, was selected to improve our ability to detect halogenated volatile compounds (e.g., chlorinated solvents such as trichloroethene), while the PID was selected because of its ability to identify volatile petroleum constituents (e.g., the aromatic compounds benzene, toluene, ethylbenzene, and xylene).

At least 25 percent of the samples collected were split and sent to an offsite laboratory for confirmatory VOC analysis using EPA Method 8240. This method requires the use of a gas chromatograph with mass spectrometer (GC/MS). GC/MS methods are generally more accurate for compound identification, but less accurate (than GC with a detector other than a MS) for determining the concentrations of the identified compounds.

Reasons for selecting VOC analysis as the field screening analytical method include:

- It is a good "indicator" method. Many wastes that require other methods for detection (e.g., metals or PCBs) are often contained in petroleum products that have volatile constituents. Thus, detection of VOCs indicates that a waste release has possibly occurred, and further investigation may be necessary.
- Though the required laboratory equipment is sophisticated, the amount of equipment needed and sample preparation are fairly minimal.
- Test results can be obtained within hours which facilitates quick decision making and sampling strategy development.
- Chlorinated solvents can be detected. These are primary contaminants of concern because they are often "sinkers" that can threaten groundwater supplies and many of them are carcinogens.

The sampling strategy was essentially the same for all SWMUs, but was often modified based on site-specific conditions. An attempt was made at each SWMU to collect the following samples:

- Shallow soil from the unsaturated zone in the loess (usually less than 13 feet bls).
- Shallow groundwater from the loess (typically at 13 feet bls or a little deeper). If the formation was too tight to yield water, a soil sample was usually collected.

- Intermediate groundwater from the loess (typically about 25 feet bls). If groundwater could not be obtained, soil samples were usually collected.
- Deeper groundwater from the top of the fluvial deposits (typically around 40 feet bls). The fluvial deposits are much more permeable than the loess. Therefore, they yield more water than the loess and also provide less resistance to lateral migration of contaminants. The top of the fluvial deposits was also the maximum depth of penetration for the DPT rig due to the type of material (sand and gravel) that makes up the formation.

All samples at SWMUs 1 (Fire Department Drill Area), 8 (Cemetery Disposal Area), and 60 (Northside Landfill) were below detection limits (BDL). At SWMU 3, all samples were BDL except one shallow (17 feet bls) methylene chloride hit in groundwater that was resampled and reported as BDL the second time.

At SWMU 5 (Aircraft Fire Fighting Training Facility), no solvents were detected. As expected, petroleum constituents were detected in shallow soil and groundwater in areas of known contamination (from previous investigations). Shallow soil near the old fire extinguisher pits was heavily contaminated.

At SWMU 7 (N-126 Plating Shop Dry Well), groundwater contamination by chlorinated solvents was detected by field analyses in the mobile laboratory and confirmed by GC/MS analyses performed in an offsite laboratory. The contamination was detected at depths of 36 to 42 feet and ranged from 5.4 ppb cis-1,2-Dichloroethene to 320 ppb 1,1-Dichloroethane. The source of the contamination is believed to be a grassy area south of the dry well where used solvents were reportedly poured directly onto the ground. Groundwater contamination (6 ppb 1,1-Dichloroethane and 2.6 ppb Trichloroethene) was detected adjacent to Production Well No. 1 at 43 feet; however, water samples collected from the production well, which is screened at 523 feet, were not contaminated.

SWMU 1 — Fire Department Drill Area

Background

The Fire Department Drill Area (Figure 1) was used to train firemen in fire fighting and crew rescue techniques for downed aircraft. The area, which consisted of approximately 3,000 square feet of existing asphalt runway on the approach end of abandoned Runway 09, is now part of the airfield.

One training session per month was conducted in this area from 1960 until 1984. During each training session, approximately 55 to 100 gallons of JP-4 and waste fuels were sprayed on and around an aircraft simulator and ignited. The fire created by the burning fuel was extinguished by the training crew. A small containment area consisting of steel rails (1 inch to 2 inches high and 15 to 20 feet square) in the form of a box with an asphalt bottom was used to contain the fuel during training exercises. Fire training is currently conducted at the Fire Fighting Training Area (SWMU 5) near the southwest corner of the North Complex.

Summary

Soil and groundwater samples were collected at the six locations shown in Figure 1. The attached table provides the sample depths and types (i.e., soil or water). No contamination was detected during the survey, which is consistent with the results of the interim measure investigation conducted in 1992. The only sample result of concern from the interim measure investigation was an anomalous acetone "hit" in a soil sample collected near the southwest corner of the site. During the DPT survey, a soil sample was collected at the same location and depth and sent to an offsite laboratory for GC/MS analysis. No contaminants were detected in this sample or any other soil or groundwater sample collected during the DPT survey, including a soil sample collected 7 feet below the center of the burn area.

1.0 INTRODUCTION

This report presents the analytical data collected during the Resource Conservation Recovery Act Facility Investigation (RFI) of Naval Support Activity (NSA) Memphis Assembly A Solid Waste Management Unit (SWMU) 1 and the quality assurance/quality control (QA/QC) evaluation of those data. The purpose of the data evaluation is to verify that the QC requirements of the data set have been met and to characterize the weakness of any questionable data.

The Assembly A soil samples were collected at NSA Memphis on January 31, 1996; submitted to National Environmental Testing, Inc., laboratory in Bedford, Massachusetts; and reported using U.S. Environmental Protection Agency (USEPA) Data Quality Objectives (DQO) Level III and Level IV equivalents. The analytical methods and DQO laboratory deliverables are summarized in Table 1.

Table 1

Organophosphorus Pesticides (OP Pesticides)	IV	SW-846 8140
Total Petroleum Hydrocarbons (TPH)	III	USEPA 418.1
Metals	IV	40 Code of Federal Regulations Part 264 Appendix IX (SW-846 6010/7060/7421/7471/7740/7841)
Cyanide	III	SW-846 9010
Gasoline Range Organics (GRO)	III	Modified 8015/TN GRO, 8020
Diesel Range Organics (DRO)	III	Modified 8015/TN DRO

The references for the methods listed in Table 1 were obtained from the following sources:

- USEPA Office of Solid Waste and Emergency Response, *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (SW-846), Third Edition, revised July 1992.
- USEPA Environmental Monitoring and Support Laboratory, *Methods for Chemical Analysis of Water and Wastes* (EPA-600/4-79-020, revised March 1983).
- USEPA *Title 40 Code of Federal Regulations Part 264, Appendix IX* (52 Federal Register 25947, July 1987)

Data were validated using the following documents (as appropriate):

- *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, February 1994 (EPA-540/R-94/012).
- *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, February 1994 (EPA-540/R-94/013).

The NSA Memphis data were validated by EnSafe/Allen and Hoshall (E/A&H) at DQO Level III. The data validation findings were summarized separately for each sample delivery group (SDG). Each SDG usually contains 20 samples of one matrix type, i.e., either a solid (soil and/or sediment) or water (groundwater and/or surface water) samples, except for QC samples. QC samples are included in each SDG, but are not counted as part of the 20 samples. The data summary tables are included in Attachment A to this document.

Section 2 discusses the significant data validation findings for the metals, cyanide, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticide/polychlorinated biphenyl (PCB), herbicide, organophosphorus (OP) pesticide, diesel range organics (DRO), and gasoline range organics (GRO) analyses at SWMU 1.

1.1 Organic Evaluation Criteria

The USEPA methods described in the following define QC criteria that the laboratory must meet:

- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods*
- *Methods for Chemical Analysis of Water and Wastes.*

These methods do not address data evaluation from a user's perspective. Evaluation criteria are available in *USEPA Contract Laboratory National Functional Guidelines for Organic Data Review (Organic Functional Guidelines)*, February 1994, which was used throughout the data evaluation process when the analytical methods did not address data usability.

Data evaluation for samples collected at NSA Memphis included the following parameters:

- Holding times
- Gas chromatograph/mass spectrometry (GC/MS) instrument performance checks
- Surrogate spike recoveries
- Instrument calibration
- Matrix spike and matrix spike duplicates (MS/MSD)
- Blank analysis
- Internal standard performance
- Compound quantitation
- Field duplicate precision

According to the Organic Functional Guidelines, when the QC parameters do not fall within the specific method guidelines, the data evaluator annotates or "flags" the corresponding compounds where deficiencies were found. NSA Memphis data were evaluated using this approach. The following flags were used to annotate data with laboratory and/or field deficiencies or problems:

- U Undetected** — The analyte was analyzed for but not detected or was also found in an associated blank, but at a concentration less than 10 times the blank concentration for common laboratory constituents (contaminants) or five times the blank concentration for other constituents; the associated value shown is the quantitation limit. The quantitation limit is the minimum level of detection acceptable under the contract Statement of Work.
- J Estimated Value** — One or more QC parameters were outside control limits or the concentration of the analyte was less than the Practical Quantitation Limit (PQL).
- UJ Undetected and Estimated** — The analyte was analyzed for but not detected above the listed estimated quantitation limit; the quantitation limit is estimated because at least one QC parameter was outside control limits.
- D Diluted Result** — The compound was reanalyzed at a secondary dilution factor. If at least one compound was outside the calibration range during an initial analysis, the laboratory flags the analyte "E." When diluted, the sample results will be flagged "D." Generally, values from the initial analysis will be used except where the value exceeded the calibration range. Values exceeding the calibration range in the initial analysis will be substituted by the diluted value to ensure the most representative data. The "D" flag will remain on the value to alert the data user that the secondary dilution value was used.
- R/UR Unusable Data** — At least one QC parameter grossly exceeded control limits.

These validation flags were applied to data where deficiencies were noted. Attachment A includes tables of all qualified data.

1.1.1 Holding Times

Acceptable technical holding times are specified in the analytical methods. The sample holding time depends on the type of analysis and whether the sample was preserved. For water samples, the holding time for preserved VOC and GRO analysis is 14 days from the collection date. SVOC, pesticide/PCB, OP pesticide, and chlorinated herbicide water samples must be extracted within seven days (14 days for DRO) and analyzed within 40 days after extraction. Holding times for soil matrices are not specified in SW-846. Therefore, data reviewers can apply the water sample holding times criteria to soil at their discretion.

1.1.2 GC/MS Mass Calibration (Instrument Performance Checks)

Tuning and performance criteria are established to ensure that the data produced by the instrument may be correctly interpreted according to the requirements of the method being used. These criteria are not sample-specific; conformance is determined using standard materials. Therefore, these criteria must be met in all circumstances. The performance standards for VOC (bromofluorobenzene [BFB]) and SVOC (decafluorotriphenylphosphine [DFTPP]) analyses are evaluated to determine if the data produced by the instrument may be correctly interpreted according to the method requirements. Performance standards must be analyzed within 12 hours of sample analysis, and the results must be within the established criteria.

1.1.3 Surrogate Spike Recoveries

Surrogate compounds are added to samples and laboratory blanks before extraction and sample preparation to evaluate the effect of the sample matrix on extraction and measurement procedures. Surrogates are organic compounds which are chemically similar to analytes of interest but not normally found in environmental samples. Three surrogate compounds are added to samples for VOC analysis, eight are added to samples for SVOC analysis, two are added to

pesticide/PCB samples, and one is added to both OP pesticides and chlorinated herbicides. Percent recovery (%R) of the surrogates is calculated by comparing the amount of the compound recovered by the analysis to the amount added to the sample.

Below is a list of surrogate compounds recommended by the SW-846 methods. Abbreviations for each compound are in parentheses (when applicable).

<u>VOC Surrogates</u>	<u>SVOC Surrogates</u>	<u>Pesticide/PCB Surrogates</u>	<u>Herbicide Surrogate</u>	<u>OP Pesticide Surrogate</u>
Toluene-d8 (TOL)	Nitrobenzene-d5 (NBZ)	Tetrachloro-m-xylene (TCMX)	DCAA	4-Chloro-3-Nitrobenzotrifluoride (CNBT)
BFB	2-Fluorobiphenyl (FBP)	Decachlorobiphenyl (DCB)		
1,2-Dichloroethane (DCE)	Terphenyl-d14 (TPH)			
	2,4,6-Tribromophenol (TBP)			
	Phenol-d5 (PHL)			
	2-Chlorophenol-d4 (ZCP)			
	1,2-Dichlorobenzene-d4 (DCB)			

1.1.4 Instrument Calibration

Instruments are initially and continually calibrated with standard solutions to verify that they are capable of producing acceptable quantitative data for the compounds.

Initial calibration (GC/MS): The instrument is initially calibrated at the beginning of the analytical run to check its performance and to establish a linear five-point calibration curve. The initial calibration is verified by calculating the relative response factor (RRF) and the percent relative standard deviation (%RSD) for each compound. An RRF less than 0.05 or a %RSD greater than 30% is outside the QC limits for the initial calibration.

Continuing calibration (GC/MS): Standard solutions are run periodically to check the daily performance of the instrument and to establish the 12-hour RRF on which the sample quantitations are based. The continuing calibration is verified by calculating the RRF and the percent difference (%D) for each compound. An RRF less than 0.05 or a %D greater than 25% is outside the QC limits for the continuing calibration.

Initial calibration (GC): For single-component pesticides, two separate standard mixes are used, five-point calibrations are analyzed, and calibration factors (CF) are established. The CF for single-component pesticides must be less than or equal to 20%.

The multicomponent pesticide toxaphene and all PCBs (or Aroclors) are analyzed separately. Retention times and CFs are determined for three to five primary peaks. The only review criteria for multicomponent compounds is to verify these steps were taken.

A five-point initial calibration is analyzed for GRO, DRO, herbicides, and OP pesticides. Two methods for calibration may be used: external or linear regression methods. For the external method, the initial calibration may be verified by calculating the RRF and the %RSD for each compound. An RRF less than 0.05 or a %RSD greater than 20% is outside the QC limits for the initial calibration. If linear regression is used, the correlation coefficient must meet or exceed 0.995 before the samples can be analyzed.

Continuing calibration (GC): To confirm the calibration and evaluate instrument performance for single-component pesticides, calibration verification consisting of instrument blank, performance evaluation mixtures, and the midpoint concentration of the two standard mixes are analyzed. The %D between the calculated amount and the true amount must not exceed 15% on the primary column.

Multicomponent compounds do not require continuing calibration.

For GRO, DRO, herbicides, and OP pesticides, the continuing calibration is verified by calculating the RRF and the %D for each compound. An RRF less than 0.05 or a %D greater than 15% is outside the QC limits for the continuing calibration.

For NSA Memphis, only positive results were flagged when the %RSDs and %D were outside control limits but were less than 50%. If the %RSD or %D exceeded 50%, both the positive and nondetected results were flagged. Based on professional judgment, the results were flagged because the risk would be in reporting results with a high bias rather than a low bias.

1.1.5 Matrix Spikes/Matrix Spike Duplicates

The MS, which is used to determine the accuracy of the analysis for a given matrix, consists of a known quantity of stock solution added to the sample before its preparation and analysis. Evaluating the MS data involves two calculations. First, the %R is calculated by comparing the amount of the compound recovered by the analysis to the amount added to the sample. In addition, the relative percent difference (RPD) between the MS and the MSD samples is calculated and assessed. No specific requirements have been established for qualifying MS/MSD data. However, guidelines to aid in applying professional judgment are discussed in the Organic Functional Guidelines.

1.1.6 Laboratory Control Samples and Laboratory Duplicates

Some GC methods may require that a laboratory control sample (LCS) and laboratory duplicate be performed with each SDG. The LCS monitors the overall performance of each step during analysis, including sample preparation. All aqueous LCS percent recovery results must fall within the control limits established by the laboratory. Laboratory duplicate samples are used to demonstrate acceptable method precision at the time of analysis. The RPD between the sample and the duplicate sample is calculated. Although no guidelines are established for organic laboratory duplicates, sample qualification is left up to professional judgment.

1.1.7 Blank Analysis

Laboratory method blanks are used to assess the existence and magnitude of potential contamination introduced during analysis. Additionally, *field blanks* may be collected to assess any contamination introduced while collecting samples. When chemicals are found both in

samples and laboratory blanks analyzed within the same 12-hour period and/or field-derived blanks, the usability of the data depends on the reviewer's judgment and the blank's origin. According to Organic Functional Guidelines, a sample result should not be considered positive unless the concentration of the compound in the sample exceeds 10 times the amount in any blank for common laboratory contaminants (i.e., methylene chloride, acetone, 2-butanone, and common phthalate esters), or five times the amount for other constituents. These amounts are referred to as action levels (ALs). Because blank samples may not be prepared using the same weight or volume of sample or dilution, these variables also should be considered when using these blank criteria. The specific actions to be taken are as follows:

- If a chemical is found in the blank but not the sample, no action is taken.
- If the sample concentration is less than the quantitation limit and less than the AL, the quantitation limit is reported.
- If the sample concentration is between the quantitation limit and the AL, the concentration is reported as nondetect "U."
- If the sample concentration is greater than the AL, the concentration may be used unqualified.

Field-Derived Blanks

For this project, one type of field-derived blank was collected: the *trip blank*. The trip blank is a 40-milliliter volatile organic analysis vial filled at the laboratory with certifiable water to assess cross-contamination during VOC sample shipment.

One trip blank per shipment containing samples for VOCs was collected as defined in Section 4 of the *NSA Memphis Comprehensive RFI Work Plan* (E/A&H, October 1994).

For data validation, each trip blank is associated only with the samples from the same shipment/cooler. Because field-derived blanks are used with method blanks to assess potential cross-contamination of field investigative samples, no action was taken if contamination was detected in the method blanks associated with the trip blanks.

1.1.8 Internal Standard Performance

GC/MS internal standards are added to samples to check the stability of the instrument's sensitivity and response during each analytical VOC and SVOC run. Internal standard area counts for samples and blanks must not vary more than a factor of two (-50% to +100%) from the associated calibration standard. If an internal standard area count is outside this window, action should be taken.

Listed below are the internal standard compounds recommended by the methods:

VOC Compounds

Bromochloromethane (BCM)
1,4-Difluorobenzene (DFB)
Chlorobenzene-d5 (CBZ)

SVOC Compounds

1,4-Dichlorobenzene-d4 (DCB)
Naphthalene-d8 (NPT)
Acenaphthene-d10 (ANT)
Phenanthrene-d10 (PHN)
Chrysene-d12 (CRY)
Perylene-d12 (PRY)

1.1.9 Field Duplicate Precision

One field duplicate was collected at NSA Memphis for each 10 soil samples collected. Field duplicate samples are analyzed to evaluate data precision, which measures the reproducibility of the analysis.

For the NSA Memphis RFI, RPDs between the samples and duplicates were calculated during the validation processes for sample results above the PQL. If the results for any compounds did not meet RPD criteria of less than 50% for soil, the positive results for that compound were flagged as estimated for the sample and duplicate only. If one value was nondetected and the other value was above the PQL, the positive result was flagged as estimated "J," and the nondetected result as estimated "UJ."

1.2 Inorganic Evaluation Criteria

The USEPA methods described in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* and *Title 40 Code of Federal Regulations Part 264, Appendix IX* define QC criteria that the laboratory must meet, but the methods do not address data evaluation from a user's perspective. Evaluation criteria are available in *USEPA Contract Laboratory National Functional Guidelines for Inorganic Data Review* (Inorganic Functional Guidelines), February 1994, which was used throughout the data evaluation process when the analytical methods did not address data usability.

Data evaluation for samples collected at NSA Memphis included the following parameters:

- Holding times
- Instrument calibration
- MS
- Laboratory duplicates
- Blank analysis
- Inductively Coupled Plasma (ICP) interference check samples
- ICP serial dilutions
- LCS results
- Atomic Absorption (AA) duplicate injections and postdigestion spike recoveries
- Field duplicate precision

According to Inorganic Functional Guidelines, when the QC parameters do not fall within the specific method guidelines, the data evaluator annotates or "flags" the corresponding deficient compounds. The data from NSA Memphis were evaluated using this approach. The following flags were used to annotate data exhibiting laboratory and/or field deficiencies or problems:

- U Undetected** — The analyte was analyzed for but not detected above the instrument detection limit (IDL) or was also found in an associated blank at a concentration less than five times the blank concentration. The IDL is described as the lowest possible concentration an instrument can detect a particular analyte. The IDL is determined by multiplying by three the standard deviation obtained for the analysis of a standard solution at a concentration of 3x to 5x IDL on three nonconsecutive days with seven consecutive measurements per day.
 - J Estimated Value** — At least one QC parameter was outside control limits or the analyte's concentration was less than the PQL.
 - UJ Undetected and Estimated** — The analyte was analyzed for but not detected above the listed estimated IDL; the IDL is estimated because at least one QC parameter was outside control limits.
- R/UR Unusable Data** — One or more QC parameter grossly exceeded control limits.

1.2.1 Holding Times

Acceptable technical holding times are specified in the analytical methods. For aqueous samples, the holding time for cyanide analysis is 14 days, and metals analysis is six months, except for mercury, which is 28 days from the date of collection. Holding times for soil are not specified in the methods. Therefore, data reviewers can apply the water sample holding times criteria to soil at their discretion.

1.2.2 Instrument Calibration

Initial and continuing calibrations of the instruments with standard solutions are used to check that the instrument is capable of producing acceptable qualitative and quantitative data for the analytes on the Appendix IX list.

An initial calibration is performed to check the performance of the instrument at the beginning of the analytical run and to establish a linear calibration curve. Calibration standard solutions are analyzed periodically to check the performance of the instrument and confirm that the initial calibration curve is still valid. Calibrations are verified by calculating the %R and comparing the amount of the analyte recovered by analysis to the known amount of standard. The %R for metals should fall between 90% and 110%. The %R for mercury should fall between 80% and 120%, and the %R for cyanide should fall between 85% and 115%.

1.2.3 Blank Analysis

Laboratory method blanks are used to assess the existence and magnitude of potential contamination introduced during analysis. When chemicals are found in samples and laboratory blanks, the usability of the data depends on the reviewer's judgment and the blank's origin. According to Inorganic Functional Guidelines, a sample result should not be considered positive unless the compound concentration in the sample exceeds five times the amount in any blank. These amounts are referred to as ALs. Because blank samples may not be prepared using the same weight or volume of sample or dilution, these variables also should be considered when using these blank criteria. The specific actions to be taken are as follows:

- If a chemical is found in the blank but not the sample, no action is taken.
- If the sample concentration is between the IDL, and less than the AL, the concentration is reported as "U."

- If the sample concentration is greater than the AL, the concentration may be used unqualified.

1.2.4 ICP Interference Check Samples

The ICP interference check sample is used to confirm the laboratory instrument's inter-element and background correction factors. Interference samples should be run at the beginning and end of each sample analysis run or at least twice per eight-hour working shift. The %R for the interference check sample should fall between 80% and 120%.

1.2.5 Laboratory Control Samples

LCSs are used to monitor the overall performance of steps in the analysis, including the sample preparation. All aqueous LCS %R results must fall within the control limits of 80% to 120%, except for antimony and silver for which control limits have not been established. Soil LCS standards are generally provided by the USEPA (or state agency or private laboratory). Control limits are established for each soil LCS standard prepared.

1.2.6 MS Analysis

Samples are spiked with known quantities of analytes to evaluate the effect of the sample matrix on digestion and measurement procedures. The %R should be within 75% to 125%. However, when the sample concentration exceeds the spike concentration by a factor of four or more, spike recovery criteria are not applicable.

1.2.7 Laboratory Duplicates

Laboratory duplicate samples are analyzed to evaluate data precision, a measure of the reproducibility of the analysis. The RPD between the sample and the duplicate sample is calculated. A control limit of 20 RPD for aqueous samples and 35% for soil or sediment samples should not be exceeded for analyte values greater than the quantitation limit or two times the quantitation limit, respectively.

1.2.8 ICP Serial Dilutions

ICP serial dilutions assess whether matrix interference occurred. One sample from each set of similar matrix type is chosen for the serial dilution (a fivefold dilution). For an analyte concentration that is at least a factor of 10 times above the instrument detection limit, the measured concentrations of the undiluted sample and of the diluted sample should agree within 10%.

1.2.9 AA Duplicate Injections and Postdigestion Spike Recoveries

During AA analysis, duplicate injections and postdigestion spikes are used to assess precision and accuracy of the laboratory analysis. The %RSD of duplicate injections must agree within 20%. Percent recovery of the postdigestion spike sample should fall between 85% and 115%.

1.2.10 Field Duplicate Precision

One field duplicate was collected for each 10 soil samples collected. Field duplicate samples are analyzed to evaluate data precision, which measures the reproducibility of the analysis.

For the NSA Memphis RFI, RPDs between the samples and duplicates were calculated during the validation processes for sample results above the PQL. If the results for any compounds did not meet RPD criteria of <30% for water and <50% for soil or sediment, the positive results for that compound were flagged as estimated for the sample and duplicate only. If one value was nondetected and the other value was above the PQL, the positive result was flagged as estimated "J," and the nondetected result as estimated "UJ."

2.0 DATA VALIDATION RESULTS — SWMU 1

All samples were received by the laboratory intact and with the proper documentation. Table 2 summarizes the samples that were included in SWMU 1.

Table 2
 SWMU 1 Sample IDs

Sample ID	VOCs	SVOCs	Pest/PCB	OP Pest	Herb	DRO	GRO	Metals & Cyanide
001CHA0101	X	X	X	X	X	X	X	X
001CHA0101DL2			X					
001SHA0101	X	X	X	X	X	X	X	X
001SHA0101DL2			X					
001SHA0201	X	X	X	X	X	X	X	X
001SHA0301	X	X	X	X	X	X	X	X

Three investigative samples and one field duplicate were analyzed in SDG 1686 for SWMU 1. Validated data tables can be found in Attachment A of this document.

2.1 Data Quality

The overall data quality of the analytical work performed for NSA Memphis at SWMU 1 was considered satisfactory and usable for site remediation and risk assessment. Results that were outside QA/QC requirements were flagged as estimated "J," indicating that the data could be biased either high or low. Although the data are qualified as estimated, they remain dependable for use in risk assessment and site remediation. The following sections address only the data that exhibited deficiencies resulting in qualification.

2.2 Appendix IX Metals and Cyanide

2.2.1 Blanks

Silver was detected in the preparation blank at a concentration of 3.4 micrograms per liter ($\mu\text{g/L}$). Samples 001SHA0101, 001CHA0101, and 001SHA0201 exhibited concentrations less than the AL of 17 $\mu\text{g/L}$ (3.4 milligrams per kilogram [mg/kg]) and were qualified as nondetect.

Tin demonstrated negative bias in the initial calibration blank (ICB) (-23.1 $\mu\text{g/L}$) and in the preparation blank (-6.028 mg/kg). All results less than 10 times the absolute value of the highest detection (46.2 mg/kg, 231 $\mu\text{g/L}$) were qualified as estimated (J) for positive results and (UJ) for undetected results.

2.2.2 Matrix Spike Recovery

Antimony (38.9%) and selenium (60.5%) displayed %Rs outside the 75% to 125% control limits. All antimony and selenium results were qualified as estimated (J) for positive results and (UJ) for undetected results. Lead (-28.5%) exhibited a %R less than 30% and was qualified as estimated (J) for positive results and unusable (UR) for undetected results.

2.2.3 Laboratory Duplicates

Chromium (50.0%) demonstrated a RPD greater than the control limits of 35%. All positive chromium results were qualified as estimated (J) and undetected results were accepted without qualification.

2.3 Volatile Organic Compounds

2.3.1 Field Duplicates

Samples 001SHA0101 and 001CHA0101 were analyzed as field duplicates for SWMU 1. Xylene (100%) and ethylbenzene (169%) displayed RPDs greater than 50%. Xylene was qualified as estimated (J) for positive results and ethylbenzene was qualified as estimated (J) for a positive result and (UJ) for an undetected result in these two samples only.

2.4 Pesticide/Polychlorinated Biphenyls

2.4.1 Surrogate Recovery

Samples 001SHA0201 (141%, 139%) and 001CHA0101DL2 (144%, 140%) exhibited percent recoveries greater than the 40% to 137% control limits for tetrachloro-m-xylene (TCMX) on both the primary and confirmation columns. Samples 001SHA0301 (145%) and 001SHA0101

(166%) exhibited %Rs greater than the 40% to 137% control limits for TCMX on the primary column only. All positive results in these samples were qualified as estimated (J). All undetected results were accepted without qualification.

2.4.2 Field Duplicates

Samples 001SHA0101 and 001CHA0101 were analyzed as field duplicates for SWMU 1. Heptachlor epoxide (58.1%) displayed a RPD greater than 50%. Heptachlor epoxide was qualified as estimated (J) for a positive result and (UJ) for an undetected result in these two samples only.

2.5 Herbicides

2.5.1 Laboratory Control Samples

Dinoseb (0.0%) did not display a percent recovery for the LCS. All results for SWMU 1 were undetected and qualified as unusable (UR).

2.6 OP Pesticides

2.6.1 Laboratory Control Samples

Naled (39%) demonstrated a %R less than the 50% to 150% control limits. All results for SWMU 1 were undetected and qualified as estimated (UJ).

FROM: Brian Mulhearn, E/A&H

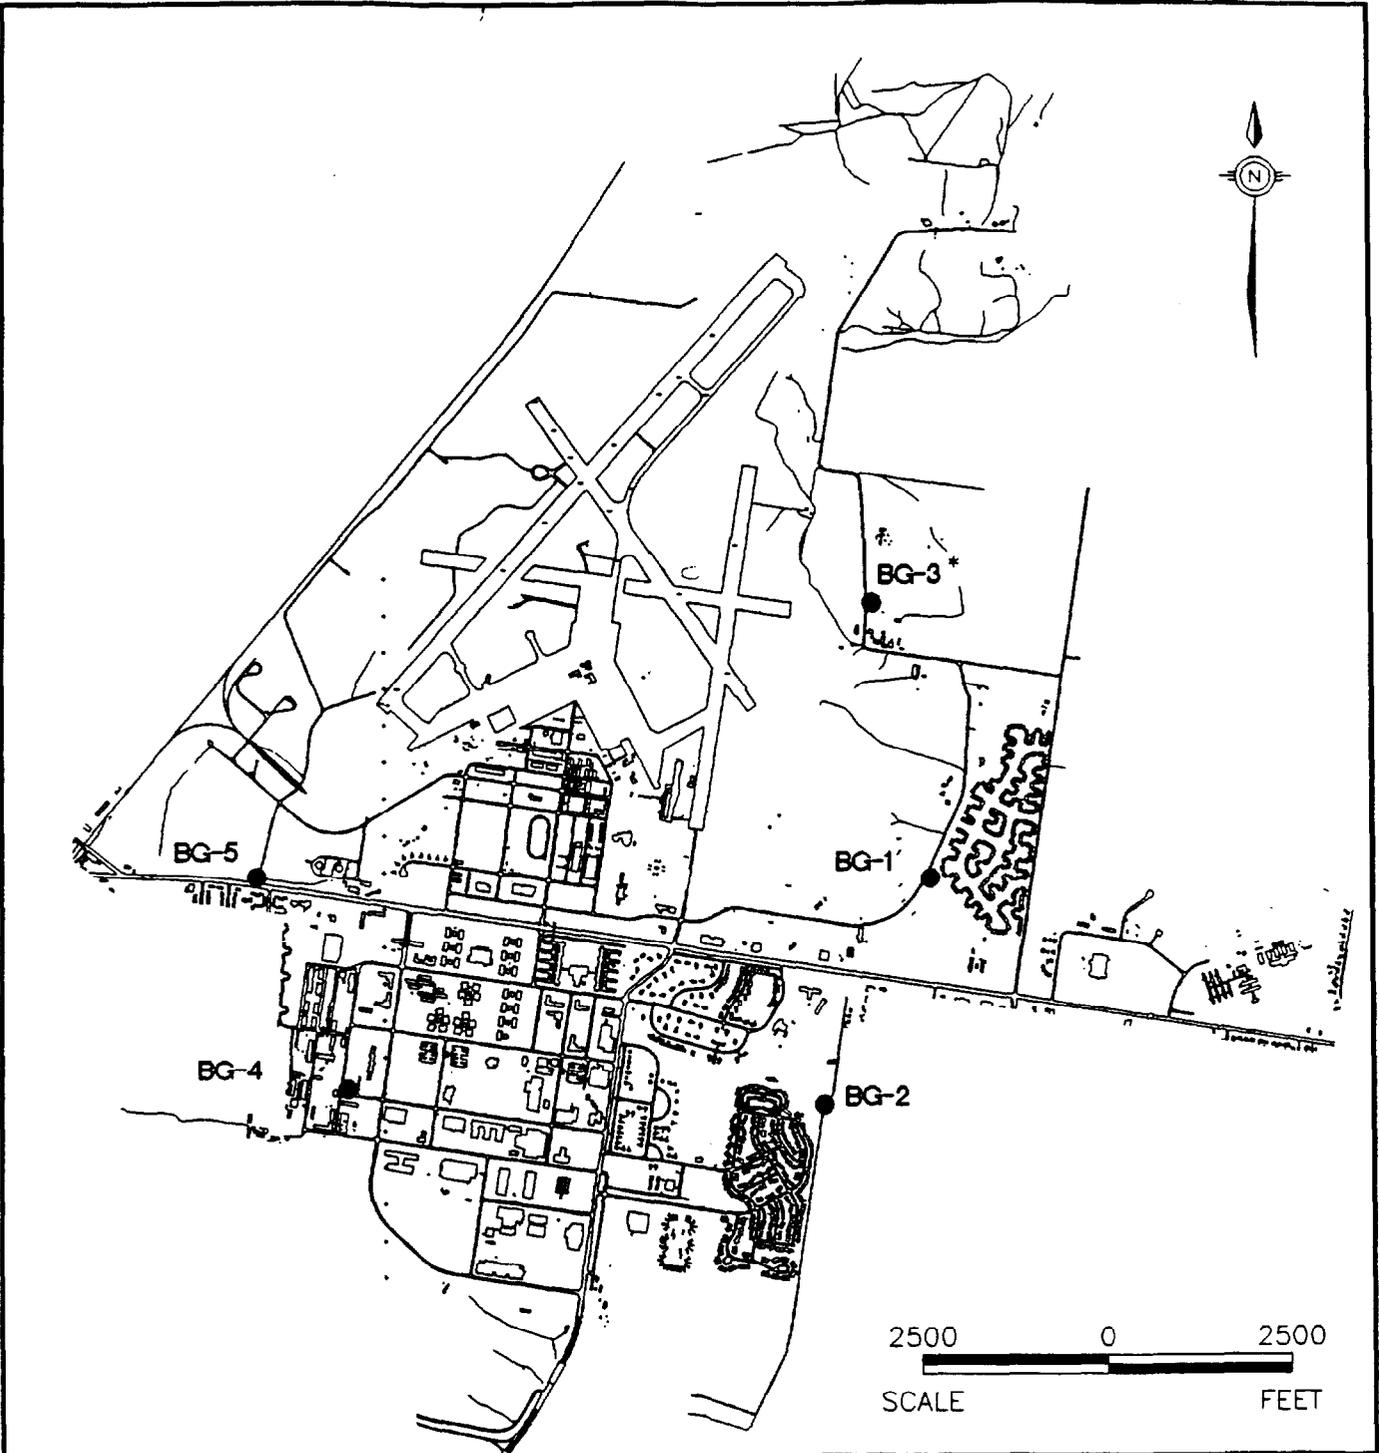

DATE: September 18, 1996

RE: Assemblies A through D Background Reference Concentrations

The purpose of this technical memorandum is to document the methods used to calculate Naval Support Activity (NSA) Memphis reference concentrations (RCs) for Assemblies A, B, C, and D. USEPA Region IV recommends using two-times the mean concentration, which was the method used to calculate RCs presented in this memorandum. RCs were calculated based on facility-wide data, and sample locations are shown in Figure 1. RCs were calculated separately for the loess, upper fluvial deposits, lower fluvial deposits, combined upper and lower fluvial deposits, alluvial, and upper Cockfield Formation water bearing zones. RCs were calculated separately for surface (0-1 foot) and subsurface soil. As discussed in Section 2.9 of the *Comprehensive RFI Work Plan* (E/A&H, 1994), there are 13 soil types at NSA Memphis. Eleven are silty loams, and two are fill containing silt. NSA Memphis soil was assumed to be homogeneous, and the average background concentration was assumed to represent base-wide conditions. RCs do not account for different soil types.

Table 1 summarizes NSA Memphis RCs. A data validation report and analytical data used to calculate RCs are included in Attachment 1. Tables 2, 3, 4, 5, 6, and 7 summarize samples and data used for loess, upper fluvial deposits, lower fluvial deposits, combined fluvial deposits, alluvial, and upper Cockfield Formation groundwater, respectively. Table 8 summarizes samples used and RCs calculated for surface and subsurface soil. For each background dataset, some inorganics were not detected by the reporting laboratory. These were noted as not applicable in Tables 2

This page intentionally left blank.

LEGEND

* SOIL BACKGROUND DATA ONLY

BG-2 BACKGROUND LOCATION 2

NOTE: SOIL DATA CONSIST OF ONE SURFACE & TWO SUBSURFACE SOIL SAMPLES. GROUNDWATER DATA CONSIST OF THREE SAMPLES; THE LOESS, UPPER FLUVIAL & LOWER FLUVIAL DEPOSITS.

through 8. Some inorganics were reported in 100% of the samples, and the arithmetic mean was calculated to determine the average background concentration. Other inorganics were reported in less than 100% of the samples analyzed, and for those, nondetects were reported as "U" values, which are the concentrations detectable by the laboratory.

Different methods were used to account for nondetects because suggested methods for calculating default concentrations and management of field duplicate data changed over time, and RCs were calculated for each medium at different times on an as-needed basis. If an inorganic was detected in less than 100% of the samples, that inorganic was assumed to be present at a default concentration. The default concentration was inserted in the data where "U" values were reported before calculating the average background concentration. Data management methods and how default concentrations were determined are described below.

Loess Groundwater

One-half of each reported "U" value was used as the default concentration when calculating RCs for inorganics in loess groundwater, when the inorganic was detected in at least one sample. In addition, estimated concentrations reported as "J" values were included in the RC calculations. Field duplicate data were not collected for this dataset, which was comprised of first and second quarter groundwater monitoring data.

Upper Fluvial Deposits, Lower Fluvial Deposits, Combined Fluvial Deposits, Alluvial, and Upper Cockfield Formation Groundwater

One-half of each reported "U" value was used as the default concentration when calculating RCs for inorganics in these water-bearing zones when the inorganic was detected in at least one sample. In addition, estimated concentrations reported as "J" values were included in the RC calculations. Field duplicate data were not included, and the dataset was comprised of first and third quarter groundwater monitoring data. Second quarter data for some inorganics were considerably elevated with respect to the first and third quarter, so second quarter data were not

included when calculating RCs. This method is more conservative because including the second quarter fluvial deposits groundwater data would elevate the average background concentrations.

Surface Soil

The arithmetic mean concentration was multiplied by two to calculate the RC for all inorganics except mercury, which was the only inorganic reported in at least one sample and in less than 100% of the samples analyzed. For mercury, the lowest hit reported in background samples was divided by two, and the result was used as the default concentration for nondetects. In addition, estimated concentrations reported as "J" values were included in the RC calculations, and field duplicate data were not collected for this dataset.

Subsurface Soil

The arithmetic mean concentration was multiplied by two to calculate the RC for all inorganics except cadmium, mercury, and nickel, which were reported in at least one sample and in less than 100% of the samples analyzed. For these inorganics, the lowest hit was used as the default concentration for nondetects. In addition, estimated concentrations reported as "J" values were included in the RC calculations, and field duplicate data were included as separate samples in the dataset.

Dieldrin, a chlorinated pesticide, was used extensively in the 1950s and 1960s during a white fringed beetle quarantine. These pesticides were aurally applied across NSA Memphis, and the BRAC Cleanup Team (BCT) agreed that anthropogenic (man-made) background determinations were applicable for this compound based on the June 2, 1995 *Discussion of Dieldrin Risk Management Issues* technical memorandum, which is included as Attachment 2.

- ° Hardness, Sulfate

Thirty investigative samples and 11 field QC samples were analyzed in four SDGs for the background data. Full validation reports of each SDG and data tables can be found in Attachment A of this document.

8.1 Data Quality

The overall data quality of the analytical work performed for the background data for NAS Memphis was considered to be satisfactory and usable for site remediation and risk assessment. Results that were outside QA/QC requirements were flagged as estimated "J." The estimated qualification indicates that the data could be biased either high or low. The "J" flag alerts the data user to the possibility of a high or low bias. Although the data are qualified as estimated, they remain dependable for use in risk assessment and site remediation.

8.2 Unusable Data

A few samples were rendered unusable because the samples grossly exceeded QC parameters. Table 8-2 summarizes the unusable data and explains the qualification.

Table 8-2 Background Unusable Data			
Sample ID	Fraction	Compound(s)	Reason
2BGGMW02LF	Semivolatiles	acid fraction	Surrogate percent recovery
2BGGMW02LF	OP Pesticides	phorate demeton, S diazinon methyl parathion ronnel ferthion chlorpyritos merphos fensulfothion stirophos	Matrix spike/Matrix spike duplicate percent recoveries

Table 8-2 Background Unusable Data			
Sample ID	Fraction	Compound(s)	Reason
2BGGMW02LF 2BGGMW02LS 5BGGMW05LF 5BGHMW05LF 5BGGMW05LS 5BGGMW05UF	OP Pesticides	Dichlorvos mevinphos, alpha demeton, O ethoprop naled disulfoton tokuthion trichloronate sulprofos guthion coumophos	Matrix spike/Matrix spike duplicate percent recoveries LCS percent recovery
1BGGMW01LF 1BGHMW01LF	Semivolatiles	acid fraction	Surrogate percent recovery
1BGS000100 1BGS000101 1BGS000110 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGS000501 5BGS000510 5BGC000510	Metals	silver thallium	Matrix spike percent recovery
1BGS000100	Semivolatiles	acid fraction	Surrogate percent recovery
3BGS000310	Herbicides	dalapon dinoseb	Matrix spike/Matrix spike duplicate percent recovery
	OP Pesticides	merphos	
1BGS000101 1BGS000110 3BGS000301 3BGS000310 1BGS000100 4BGS000401 4BGS000411 2BGS000201 2BGS000210 5BGS000501 5BGS000510 5BGC000510	OP Pesticides	merphos	LCS percent recovery

Samples 1BGGMW01LF, 1BGHMW01LF, and 1BGS000100 were re-analyzed for semivolatiles; however, the surrogate results remained unchanged. The re-analysis of each sample, except for 1BGS000100, exceeded the 14-day extraction holding time by more than two times the initial holding time. Therefore, all results in samples 1BGGMW01LFRE and 1BGHMW01LFRE were qualified as unusable (R). Because the initial analysis represented the preferred holding time for all three samples, the results from the first analysis were used for investigative interpretation.

8.3 Blanks

Acetone, methylene chloride, di-n-butylphthalate, bis(2-ethylhexyl)phthalate, cadmium and lead were detected in several method and field blanks. The blanks were examined during the validation process and sample results for acetone, methylene chloride, di-n-butylphthalate, bis(2-ethylhexyl)phthalate, cadmium, and lead that were believed to be from blank contamination were nullified.

INTRODUCTION

This data review report covers 14 soil samples and 3 water samples listed on the cover page. The analyses were per EPA Method 6010, 7421, 7841, 7060, 7470, 7740, and 9010 SW846, November 1986.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February, 1994).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this SDG. The review was based on QC data.

I. HOLDING TIME

All criteria for laboratory contractual holding times were met.

II. CALIBRATION

Calibration curves were analyzed at the required frequency and met QC requirements.

CRDL standards for ICP and AA were analyzed and reported as required.

The frequency and analysis criteria of the calibration curve, initial calibration verification (ICV), and continuing calibration verification (CCV) were met.

Instrument detection limits (Form X), inter-element corrections (Form XI A & B) and linear range analysis (Form XII) were performed at required frequency.

III. BLANKS

The required frequency and criteria for blank analyses were met.

No contaminant above IDL was detected in the initial, continuing calibration, and preparation blanks except for the following:

Element	IDL (µg/L)	Initial Calibration Blank (µg/L)	Continuing Calibration Blank (µg/L)	Preparation Blank		Field Trip, or other Blank (µg/L)	Action Level (5x high. blk.)		Associated Samples
				(mg/kg)	(µg/L)		Soil (mg/kg)	Water (µg/L)	
Aluminum									
Antimony	40.0		57.2			40.0	57.2	286	All
Cadmium	3.0		-3.4	-0.63			3.4	17.0	All
Chromium	5.0			1.33	6.65	7.4	7.4	37.0	All
Copper	5.0			1.656			8.28	41.4	All
Lead	2.0					2.6	2.6	13	All
Nickel	15.0		19.1			24.1	24.1	120.5	All
Silver	3.1	3.5	9.9	1.072	8.24	8.9	9.9	49.5	All
Tin	15.0	26.6	74.6	5.662	87.32	44.2	87.32	436.6	All
Vanadium	4.0								
Zinc	5.0								

The sample data are qualified according to the contaminants found in the method blank(s). The qualified data are listed as follows:

Sample	Compound	Reported Concentration (mg/kg)	Modified Final Concentration (mg/kg)
1BGS101	Antimony	13.4B	13.4U
	Cadmium	1.9	1.9U
	Nickel	10.7	10.7U
	Silver	1.2B	1.2U
	Tin	25.7B	25.7U
1BGS110	Nickel	19.4	19.4U
	Silver	1.7B	1.7U
	Tin	32.3B	32.3U
3BGS301	Antimony	10.8B	10.8U
	Cadmium	3.0	3.0U
	Nickel	15.8	15.8U
	Silver	1.5B	1.5U
	Tin	31.9B	31.9U
3BGS310	Cadmium	2.9	2.9U
	Nickel	21.5	21.5U
	Silver	1.9B	1.9U
	Tin	22.6B	22.6U
1BG210	Antimony	8.7B	8.7U
	Cadmium	2.0	2.0U
	Silver	1.2B	1.2U
4BGS401	Cadmium	3.0	3.0U
	Nickel	20.8	20.8U
	Silver	1.6B	1.6U
	Tin	23.9B	23.9U
4BGS411	Cadmium	2.3	2.3U
	Nickel	18.1	18.1U
	Silver	1.7B	1.7U
	Tin	29.1B	29.1U
2BGS201	Cadmium	1.7	1.7U
	Nickel	12.8	12.8U
	Silver	1.6B	1.6U
	Tin	21.3B	21.3U
2BGS210	Cadmium	2.4	2.4U
	Nickel	14.2	14.2U
	Silver	1.8B	1.8U
	Tin	22.5B	22.5U
5BGS501	Cadmium	2.3	2.3U
	Nickel	10.1	10.1U
	Silver	1.5B	1.5U
	Tin	22.7B	22.7U
5BGS510	Cadmium	1.8	1.8U
	Nickel	14.1	14.1U
	Silver	2.5B	2.5U
	Tin	22.8B	22.8U
5BGS510	Cadmium	2.2	2.2U
	Silver	2.0B	2.0U
	Tin	38.7B	38.7U

IV. ICP INTERFERENCE CHECK SAMPLE (ICS)

The frequency and criteria for analysis were met.

Results for the ICP analyses of solution AB fell within 20% of the true value.

Analytes that are not present in the ICS solution but have an absolute value > IDL are listed below:

Sample	Element	Initial Found (µg/L)	Final Found (µg/L)	IDL (µg/L)	Affected Sample	Affected Element	Flag
ICSA	Barium	22	22	2.0	1BG210 1BG210D	Ag	J
	Cadmium	31	28	3.0			
	Chromium	-18	-18	5.0			
	Copper	21	23	5.0			
	Silver	6	11	3.0			
	Vanadium	-11	-10	4.0			
	Zinc	64	64	5.0			

Samples 1BG210 and 1BG210D have comparable or higher levels of interferants than the ICS solution. Silver concentrations in these two samples approximate those levels found in the ICS. Therefore, Silver results in samples 1BG210 and 1BG210D were qualified as estimated.

V. LABORATORY CONTROL SAMPLE (LCS)

The frequency and criteria for analysis were met.

VI. DUPLICATE SAMPLE ANALYSIS

Frequency and criteria for analysis were met except for the following:

Element	RPD	QC Limit	Associated Samples	Flag
Lead	103.8	35%	All	J

VII. MATRIX SPIKE SAMPLE ANALYSIS

Spiked sample analysis was performed as required. The percent recoveries were within advisory limits of 75-125% except for the following:

Analyte	%R	Associated Samples	Qualifications	Flag
Antimony	12.8	All	75-125%	+J/-R
Arsenic	-17.4	All	75-125%	+J/-R
Cadmium	73.9	All	75-125%	+J/-UJ
Cobalt	71.4	All	75-125%	+J/-UJ
Nickel	72.6	All	75-125%	+J/-UJ
Selenium	37.5	All	75-125%	+J/-UJ
Thallium	26.4	All	75-125%	+J/-R
Zinc	74.0	All	75-125%	+J/-UJ
Tin	45.5	All	75-125%	+J/-UJ

Post digestive/distillation spike was performed for element outside of the control recovery limit.

VIII. GRAPHITE FURNACE ATOMIC ABSORPTION QC

The samples/elements for duplicate injection have %RSD within $\pm 20.0\%$.

The analytical spike recoveries were within QC limit of 85-115% except for the following:

Sample	Element	%R	QC Limit	Flag
1BGS101	Selenium	116	85-115%	UJ
1BG210D	Selenium	46.0	85-115%	None(MSA passed)
	Lead	74.5	85-115%	None(MSA passed)
3BGS310	Lead	78.5	85-115%	None(MSA passed)
	Selenium	82.0	85-115%	UJ
5BGS510	Arsenic	125.8	85-115%	None(MSA passed)
	Selenium	83.5	85-115%	UJ
5BGC510	Arsenic	115.5	85-115%	J(MSA failed)
1BG210D	Arsenic	65	85-115%	J(MSA failed)
1BG210	Selenium	56	85-115%	UJ

MSA was performed and the results were within QC limit.

The following samples/elements have correlation coefficients <0.995 and are qualified as (J):

Sample	Element	Correlation Coefficient	QC Limit	Flag
1BG210D	Arsenic	0.9851	0.995	J
5BGC510	Arsenic	0.9924	0.995	J

MSA was required for the following samples but were not performed

Sample	Element	Flag
1BGS101	Selenium	UJ
5BGS510	Selenium	UJ
1BG210	Selenium	UJ
3BGS310	Selenium	UJ

IX. ICP SERIAL DILUTION

The frequency and criteria for analysis were met except for the following:

Element	IDL (µg/L)	50 x IDL (µg/L)	I (µg/L)	S (µg/L)	%D	Associated Samples	Flag
Barium	2.0	100	482.9	411.9	14.7	All	J(detects)/None(non-detects)
Tin	15.0	750	817.4	181.81	77.8	All	J(detects)/None(non-detects)
Zinc	5.0	250	392.6	348.3	11.3	All	J(detects)/None(non-detects)

I = Initial sample results

S = Serial dilution result (instrument reading x 5)

X. SAMPLE RESULTS VERIFICATION

No raw data were reviewed.

XI. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. All detected analytes were within RPD limit.

XII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Inorganic Data Qualification Summary - SDG Nº FD1303

SDG Nº	Sample ID	Parameter	Flag	Reason

INTRODUCTION

This data review report covers 14 soil samples and 6 water samples listed on the cover page. The analyses were per EPA Method 8240 in SW846.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993). The subsections correlate to the above guidelines. In the event that the SW846 requirement is different from that of the guidelines, the guideline QC limit will be replaced by the SW846 QC limit.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this SDG. The review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. GC/MS INSTRUMENT PERFORMANCE CHECK

Instrument performance check was carried out at 12-hour intervals.

All ion abundance requirements were met.

III. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

For all compounds and surrogates, percent relative standard deviations (%RSD) for RRF and relative response factors (RRF) met QC requirements.

IV. CONTINUING CALIBRATION

Continuing calibrations were run at the required frequency.

The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF and all of the continuing calibration RRF values met QC requirements except for the following:

Date/ Time	Instrument	Compound	%D (SW846 QC Limit)	Associated Samples	Flag
01/13/95 11:46	HP5970E	Chloromethane Bromomethane Carbon disulfide	-38.4 (+25.0%) -26.4 (+25.0%) -26.3 (+25.0%)	BG2T011195	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
01/17/95 11:58	HP5907E	Acetone	-79.3 (+25.0%)	BG2E011195 BG2F011195 BG5T011295	J(detect)/UJ(non-detect)
01/18/95 10:44	HP5907E	Acetone	-40.7 (+25.0%)	001D011095 1BGS000100	J(detect)/UJ(non-detect)
01/17/95 12:08	HP5907F	Chloromethane Vinyl chloride Chloroethane 2-Butanone 4-Methyl-2-pentanone 2-Hexanone	30.9 (+25.0%) 25.5 (+25.0%) 40.0 (+25.0%) 31.9 (+25.0%) 29.3 (+25.0%) 28.7 (+25.0%)	1BGS000101 1BGS000110 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGC000510 5BGS000501 5BGS000510	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)

V. BLANKS

The method blank analyses were performed at required frequencies. Contaminants found in the method blank(s) are listed as follow:

Date	Blank	Compound	Concentration (µg/L)	Action Level (µg/L)		Samples Affected	Reported Concentration (µg/L)	Modified Final Concentration (µg/L)
				5 x	10 x			
01/17/95	VBLK011794K	Methylene chloride	2J		20	1BGS000101 1BGS000110 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGS000510 5BGS000501 5BGC000510	4BJ 4BJ 4BJ 4BJ 5BJ 5BJ 4BJ 4BJ 5BJ 4BJ 4BJ	13U 13U 13U 12U 12U 12U 12U 13U 13U 12U 13U
01/18/95	VBLK011895E	Methylene chloride	350J		3500	1BGS000100	420BJ	1400U

The field blank analyses were performed at required frequencies. Contaminants found in the field blank(s) that resulted in data qualifications are listed as follow:

Date	Blank	Compound	Concentration (µg/L)	Action Level (µg/L)	10 x	Samples Affected	Reported Concentration (µg/kg)	Modified Final Concentration (µg/kg)
01/18/95	001D011095	Acetone	45	450		3BGS000301	7J	12U
01/17/95	BG2E011185	Methylene chloride	1BJ	10		1BGS000100 4BGS000401 4BGS000411	420BJ 4BJ 4BJ	1400U 12U 13U

01/16/95	001T011095	Methylene chloride	4BJ	40		1BGS000101 1BGS000110 3BGS000301 3BGS000310	4BJ 4BJ 5BJ 5BJ	13U 13U 12U 12U

VI. SYSTEM MONITORING COMPOUNDS

System monitoring compounds were added to all samples and blanks as required by the SW846.

All system monitoring compound recoveries met QC requirements.

VII. MATRIX SPIKES/MATRIX SPIKE DUPLICATES

One set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VIII. LABORATORY CONTROL SAMPLES

LCS not required by SW846.

IX. REGIONAL QUALITY ASSURANCE AND QUALITY CONTROL

Not applicable.

X. INTERNAL STANDARDS

All internal standard areas and retention times met QC requirements.

XI. TARGET COMPOUND IDENTIFICATION

No raw data were reviewed.

XII. COMPOUND QUANTITATION AND REPORTED CROLS

No raw data were reviewed.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

No raw data were reviewed.

XIV. SYSTEM PERFORMANCE

No raw data were reviewed.

XV. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. All detected analytes were within QC limit.

XVI. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Volatile Data Qualification Summary - SDG N° FD1303

INTRODUCTION

This data review report covers 15 soil samples and 3 water samples listed on the cover page. The analyses were per EPA Method 8270 in SW846.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993); the following subsections correlate to the above guidelines. In the event that the SOW requirement is more stringent than that of the guidelines, the guideline QC limit will be replaced by the SOW QC limit.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this package. The review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met except for the following:

Sample	Matrix	Out of Limit Contractual Analysis Holding Time/ QC Limit	Flag
1BG2000100RE	Soil	16 (14)	J(detect)/UJ(non-detect)

1BG2000100RE is the re-extracted sample of 1BG2000100. Both samples gave similar low acid surrogate recovery. In addition, 1BG2000100 RE was extracted out of technical holding time, had blank contamination and with more compounds that failed CCV %D. Therefore, data from 1BG2000100 should be reported.

II. GC/MS INSTRUMENT PERFORMANCE CHECK

Instrument performance check was carried out at 12-hour intervals.

All ion abundance requirements were met.

III. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

For all compounds and system monitoring compounds, percent relative standard deviations (%RSD) for RRF and relative response factors(RRF) met requirement except for the following:

Date	Instrument	Compound	%RSD (Guideline QC Limit)	Associated Samples	Flag
01/16/95	HP5970F	2,4-Dinitrophenol	44.7 (<30%)	All samples	J(detect)/UJ(non-detect)

IV. CONTINUING CALIBRATION

Continuing calibrations were run at the required frequency.

The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF was within ± 25.0 percent and all of the continuing calibration RRF values were greater than or equal to 0.05 per guideline (unless QC limits were replaced by more stringent SOW QC limits) except for the following:

Date	Instrument	Compound	%D (Guideline QC Limit)	Associated Samples	Flag
01/19/95	HP5970F	3-Nitroaniline	-32.8 (<25%)	None	None
		4-Nitroaniline	-43.0 (<25%)		
		Carbazole	-25.2 (<25%)		
		3,3'-Dichlorobenzidine	-29.3 (<25%)		

Date	Instrument	Compound	%D (Guideline QC Limit)	Associated Samples	Flag
01/20/95	HP5970F	Hexachlorocyclopentadiene 2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol 3,3'-Dichlorobenzidine	50.0 (< 25%) 65.2 (< 25%) 47.3 (< 25%) -25.6 (< 25%)	None	None None None None
01/25/95	HP5970F	4-Chloroaniline Hexachlorocyclopentadiene 4-Nitroaniline N-Nitrosodiphenylamine 3,3'-Dichlorobenzidine	73.6 (< 25%) 26.2 (< 25%) -25.3 (< 25%) 64.0 (< 25%) -54.3 (< 25%)	1BG2000100 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGC000510 5BGS000501 5BGS000510 BG2E011195 BG2F011195	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
01/26/95	HP5970F	4-Chloroaniline Hexachlorocyclopentadiene 4-Nitroaniline N-Nitrosodiphenylamine 3,3'-Dichlorobenzidine	73.6 (< 25%) 26.2 (< 25%) -25.8 (< 25%) 63.7 (< 25%) -46.3 (< 25%)	1BGS000101 1BGS000110	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)*
01/30/95	HP5970F	4-Chloroaniline Hexachlorocyclopentadiene 3-Nitroaniline 4-Nitroaniline N-Nitrosodiphenylamine 3,3'-Dichlorobenzidine	74.0 (< 25%) 31.7 (< 25%) -29.6 (< 25%) -38.5 (< 25%) 61.1 (< 25%) -37.4 (< 25%)	1BG2000100RE	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)

V. BLANKS

The method blank analyses were performed at required frequencies.

Contaminants found in the method blanks are listed as follow:

Date	Blank	Compound	Concentration (µg/kg)	Action Level 10 (µg/kg)	Associated Samples	Reported Concentration (µg/kg)	Modified Final Concentration (µg/kg)
01/27/95	SBLK012795F	Di-n-Butylphthalate	440	4400	1BG2000100RE	330U	330U

2) Field Blank:

The field blanks were analyzed for this SDG.

No contaminant was found in the field blanks.

VI. SYSTEM MONITORING COMPOUNDS

System monitoring compounds were added to all samples and blanks as required by the SOW.

All system monitoring compound recoveries met QC requirements except for the following:

Sample	System Monitoring Compound	%R	QC Limit	Compounds Affected	Flag
1BG2000100	2-Fluorophenol	19	25-121%	Acid fraction	J(detect)/R(non-detect)
	2,4,6-Tribromophenol	5	19-122%		
1BG2000100RE	2-Fluorophenol	19	25-121%	Acid fraction	J(detect)/R(non-detect)
	2,4,6-Tribromophenol	0	19-122%		

VII. MATRIX SPIKES/MATRIX SPIKE DUPLICATES

One set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VIII. LABORATORY CONTROL SAMPLES

LCS not required by SW-846.

IX. REGIONAL QUALITY ASSURANCE AND QUALITY CONTROL

Not applicable.

X. INTERNAL STANDARDS

All internal standard areas and retention times met QC requirements.

XI. TARGET COMPOUND IDENTIFICATION

No raw data checks were carried out for this package.

XII. COMPOUND QUANTITATION AND REPORTED CRQLs

No raw data checks were carried out for this package.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

No raw data checks were carried out for this package.

XIV. SYSTEM PERFORMANCE

No raw data checks were carried out for this package.

XV. FIELD DUPLICATES

1 set of field duplicates were analyzed for this package. No analytes were detected.

XVI. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Semivolatile Data Qualification Summary - Case N° FD1303

INTRODUCTION

This data review report covers 17 soil samples and 5 water samples listed on the cover page. The analyses were per EPA Method 8080 in SW846, November 1986.

This review follows the approach of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. ANALYTICAL SEQUENCE

Instrument evaluation mixtures, standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

The retention time of TCX and DCB were within the QC limit.

III. INSTRUMENT PERFORMANCE EVALUATION

Not applicable.

IV. INITIAL CALIBRATION

Initial calibration of single and multi-component analytes were performed for both columns.

The retention time windows for both columns were established according to the SOW (Form 6D).

The %RSD for calibration factors of single component analytes were within QC limits (Form 6E).

V. CALIBRATION VERIFICATION

Calibration verifications of INDAM and INDBM were performed at required frequencies and sequence for both columns. The RT windows and RPD were within QC limit (Form 7E) except for the following:

Date/Time	Standard/ Column	Compound	Associated Compounds	%D (QC limit)	Reg
01/20/95 06:48	INDAM05/XT15	4,4'-DDD Methoxychlor	1BGS000101 1BGS000110 3BGS000301 3BGS000310 1BG2000100 4BGS000401 4BGS000411 2BGS000201 2BGS000210 5BGS000501 5BGS000510 5BGC000510	-18.44 ($\leq \pm 15\%$) -18.50 ($\leq \pm 15\%$)	None (confirmation only) None (confirmation only)

		alpha-Chlordane		-16.91 ($\leq \pm 15\%$)	None (confirmation only)		
		Endrin ketone		-22.18 ($\leq \pm 15\%$)	None (confirmation only)		
		01/23/95 12:39	INDBM08/RTX35	Endosulfan sulfate	4BGS000401DL 1BGS000101DL 2BGS000201DL	-15.25 ($\leq \pm 15\%$)	J(detect)/UJ(non-detect)

VI. BLANKS

Instrument blanks were performed at the required frequency. RT windows were all within QC limit.

Instrument blanks were free of contamination.

The method blanks were extracted and performed according to the SOW. The blanks were free of contamination.

The field blank analyses were performed at required frequencies. No contaminant was found in the field blank.

VII. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SOW. Surrogate spike recoveries were within QC limits except for the following:

Sample ID	Column	Surrogate Spike	%R (Adv. Limit)	Compounds Affected	Flag
BG2E011195	RTX35	TCX2	24 (31-130%)	All compounds	J(detect)/UJ(non-detect)
		DCB2	45 (51-127%)		
001D011095MD	RTX35	DCB2	49 (51-127%)	None	None (only 1 out)

VIII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Two sets of matrix spike (MS) and matrix spike duplicate (MSD) were analyzed at required frequencies. The %Rs on the MS/MSD of the investigative samples were within QC limits. Sample 001D011095 should have never been spiked since it is a field blank. No data qualification was resulted.

IX. LABORATORY CONTROL SAMPLES

No laboratory control samples were analyzed for this SDG.

X. FLORISIL CARTRIDGE CHECK

The %Rs for florisil cartridge check were within QC limit.

XI. COMPOUND IDENTIFICATION

Form I, the associated raw data, and the identification summary (Form X) were reviewed and all compounds were properly identified. %D between 2 columns met QC requirement except for the following:

Sample	Compound	%D (QC Limit)	Flag
2BGS000201	4,4'-DDT	28.6 (<25%)	J

XII. COMPOUND QUANTITATION AND REPORTED CRQLs

No raw data were reviewed for this level III package. The CRQLs of all samples were checked to make sure that they reflected all sample dilution, concentrations, split, clean-up activities, and dry weight factors. Compound quantitation and reported CRQLs met QC requirements except for the following:

Sample	Compound	Modified Results	Reported Results
1BGS000101DL	Methoxychlor	210U	2100U

The case narrative stated that XT15 was the primary column. On Form 1D, all results were reported from RTX35 instead of XT15. Since CCV results of RTX35 met QC requirements for the detected compounds, no action was taken.

XIII. SYSTEM PERFORMANCE

The quality control parameters: Resolution Checks, PEM, Standards, Blanks, MS/MSD, and Surrogate Spike Recoveries for this SDG were all properly performed and within QC limits.

XIV. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XV. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Organochlorine Pesticide/PCBs Data Qualification Summary - SDG N° FD1303

SDG N°	Sample ID	Parameter	Flag	Reason
FD1303	4BGS000401DL 1BGS000101DL 2BGS000201DL	Endosulfan sulfate	J(detect)/UJ(non-detect)	CCV %D out
FD1303	1BGS000101DL	Methoxychlor	210U	Erroneous CRDL
FD1303	2BGS000201	4,4'-DDT	J	Compound Identification %D between 2 columns

INTRODUCTION

This data review report covers 14 soil samples and 3 water samples listed on the cover page. The analyses were per EPA Method 8150, SW846, November 1986.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993) as there are no current guidelines for evaluating chlorinated pesticides.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. ANALYTICAL SEQUENCE

Standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

III. INITIAL CALIBRATION

Initial calibration of analytes were performed for both columns.

The %RSD for calibration factors of analytes were within QC limits (Form 6B) except for the following:

Date/ Time	Standard/ Column	Compounds	%RSD	QC Limit	Associated Samples	Flag
01/21/95 10:37	RF1x/RTX-35	MCP	21.8	20%	All	J(detects)/UJ(non-detects)
	RF2x/RTX-35	MCPA	27.4	20%	All	J(detects)/UJ(non-detects)
	RF10x/RTX-5	MCP	34.6	20%	All	None (confirmation only)
	RF20x/RTX-5	MCPA	34.7	20%	All	None (confirmation only)

IV. CALIBRATION VERIFICATION

Calibration verifications were performed at required frequencies and sequence for both columns. %D were within QC limit (Form 7B) except for the following:

Date/ Time	Standard/ Column	Compound	%D (QC Limit)	Associated Samples	Flag
01/21/95 19:56	8150H3/RTX-5	Dalapon	-21.3 ($\pm 15\%$)	BG2E011195	None (confirmation only)

V. BLANKS

Instrument blanks were performed at the required frequency and were free of contamination.

The method blanks were extracted and performed according to the SW846. The blanks were free of contamination.

The field blanks were extracted and performed according to the SW846. The blanks were free of contamination.

VI. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SW846. Surrogate spike recoveries were within QC limits except for the following:

Sample ID	Column	Matrix	%R (Adv. Limit %)	Compounds Affected	Flag
2BGS000210	RTX-35	Soil	126 (40-115)	All	J(detects)/None(non-detects)
2BGS000201 5BGC000510	RTX-5	Soil	176 (40-115) 135 (40-115)	All All	None (confirmation only) None (confirmation only)

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

One set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Column	Compound	MS %R (Limits)	MSD %R (Limits)	RPD (Limit)	Flag
3BGS000310	RTX-5	Dicamba MCPP 2,4-D 2,4-DB Dinoseb	4 (10-150%) 0 (10-150%)	0 (10-150%)	36 (<20%) 43 (<20%) 57 (<20%) 173 (<20%)	None (conf. only) None (conf. only) None (conf. only) None (conf. only) None (conf. only)
3BGS000310	RTX-35	Dalapon Dicamba MCPP MCPA 2,4-D Silvex Dinoseb	0 (10-150%) 0 (10-150%)	0 (10-150%) 0 (10-150%)	26 (<20%) 110 (<20%) 33 (<20%) 48 (<20%) 55 (<20%)	J(detects)/R(non-detects) J(detects)/UJ(non-detects) J(detects)/UJ(non-detects) J(detects)/UJ(non-detects) J(detects)/UJ(non-detects) J(detects)/UJ(non-detects) J(detects)/R(non-detects)

VIII. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements except for the following:

LCS	Column	LCS Spike	%R (QC Limit)	RT (QC Limit)	Associated Samples	Flag
LCS0116A	RTX-5	Dalapon	184.96 (10-150%)		BG2E011195 BG2F011195	None (confirmation only)
LCS01205	RTX-5	Dinoseb Dalapon	5.08 (10-150%) 9.16 (10-150%)	17.78 (17.83-17.93)	1BG2000100 1BGS000101 1BGS000110 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGC000510 5BGS000501 5BGS000510	None (confirmation only)
LCS01205	RTX-35	Dinoseb		25.51 (25.36-24.46)	1BG2000100 1BGS000101 1BGS000110 2BGS000201 2BGS000210 3BGS000301 3BGS000310 4BGS000401 4BGS000411 5BGC000510 5BGS000501 5BGS000510	J(detects)/UJ(non-detects)

IX. ESTERIFICATION SPIKE SAMPLE

Esterification spike samples were analyzed and met QC requirements except for the following:

EST	Column	EST Spike	%R	QC Limit	Associated Samples	Flag
ESTSPK0116	RTX-5	MCPP MCPA	253.06 222.94	10-150	BG2E011195 BG2F011195	None (conf. only) None (conf. only)

X. COMPOUND IDENTIFICATION

The %D between 2 columns were < 25% except for the following:

Sample	Compound	%D	QC Limit	Action
3BG5000310	MCPP	498.1	< 25%	J
5BGC000510	DCAA 2,4 -DB	44.9 172.5	< 25%	J
5BGS000501	MCAA 2,4 - DB	48.2 233.9	< 25%	J

XI. COMPOUND QUANTITATION AND REPORTED CROLS

No raw data were reviewed.

XII. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. All detected analytes were within QC limit except for the following:

Compound	Concentration (µg/kg)		RPD (QC Limit)	Flag
	5BGS000510	5BGC000510		
2,4-DB	9.5U	48	NA (50%)	J(detects)/UJ(non-detects)

XIII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Organochlorine Herbicides Data Qualification Summary - SDG N^o FD1303

INTRODUCTION

This data review report covers 14 soil samples and 3 water samples listed on the cover page. The analyses were per EPA Method 8140, SW846, November 1986.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993) as there are no current guidelines for evaluating chlorinated pesticides.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. ANALYTICAL SEQUENCE

Standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

III. INITIAL CALIBRATION

Initial calibration of analytes were performed for both columns.

The %RSD for calibration factors of single component analytes were within QC limits (Form 6B) except for the following:

Date/Time	Standard/Column	Compounds	%RSD	QC Limit	Associated Samples	Flag
01/24/95	RF250/Rtx5 RF500 RF1000 RF2000 RF4000	Fensulfothion	21.8	± 20%	All	J(detect)/UJ(non detect)

IV. CALIBRATION VERIFICATION

Calibration verifications were performed at required frequencies and sequence for both columns. %D were within QC limit (Form 7B) except for the following:

Date/Time	Standard/Column	Compound	%D (QC Limit %)	RT (QC Limit)	Associated Samples	Flag
01/24/95	Prime 4000/Rtx5	Demeton_O	19.99(≤15)	16.94 (16.71-16.91)	8G2E011185 8G2F011185 8G2000100 48GS000401 48GS000411	J(detect)/UJ(non-detect)
		Naled	19.98(≤15)			J(detect)/UJ(non-detect)
		Outhion	19.98(≤15)			J(detect)/UJ(non-detect)
01/26/95	OCHK1000-01/Rtx5	Demeton_O	23.06(≤15)		18GS000101 18GS000110 28GS000301 28GS000310 18G2000100 48GS000401 48GS000411	J(detect)/UJ(non-detect)
		Ethoprop	17.37(≤15)			J(detect)/UJ(non-detect)

On Form 7E, the concentration recovery window for Prime 4000 calibration check should be (3400-4600) instead of (850-1150) as indicated.

V. BLANKS

Instrument blanks were performed at the required frequency and were free of contamination except for the following:

Date	Blank	Compound	Conc. (ppb)	QC limit Conc.	Associated Samples	Flag
01/24/95	NIBLK01	Fensulfotthion	4.3	(≤1.25)	None	None

The method blanks were extracted and performed according to the SW846. The blanks were free of contamination.

The field blanks were extracted and performed according to the SW846. The blanks were free of contamination.

VI. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SW846. Surrogate spike recoveries were within QC limits except for the following:

Sample ID	Column	Surrogate Spike Compound	%R (Adv. Limit %)	Compounds Affected	Flag
1BG2000100	RTX5	4-Chloro-3-Nitrobenzotrifluoride	128 (50-120)	All	J(detect)/None(non-detect)

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

One set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Column	Compound	MS %R (Limits)	MSD %R (Limits)	RPD (Limit)	Flag
3BGS000310	Rtx5	Dichlorvos Demeton, O Demeton, S Merphos	151 (50-150) 279 (50-150) 23 (50-150) 0 (50-150)	216 (50-150) 23 (50-150) 0 (50-150)		J(detect)/None(non-detect) J(detect)/None(non-detect) J(detect)/UJ(non-detect) J(detect)/R(non-detect)

VIII. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements except for the following:

LCS	Column	Compounds Affected	%R (QC Limit)	RT (QC Limit)	Associated Samples	Flag
OPLCS0013A	Rtx5	Demeton, O Naled Demeton, S	309.4 (50-150) 43.9 (50-150) 21.9 (50-150)		BG2E011195 BG2F011195	J(detect)/None(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
OPLCS0117S	Rtx5	Demeton, O Demeton, S Merphos	393.0 (50-150) 24.1 (50-150) 0.0 (50-150)		1BGS000101 1BGS000110 3BGS000301 3BGS000310	J(detect)/None(non-detect) J(detect)/UJ(non-detect) J(detect)/R(non-detect)
OPLCS0118S	Rtx5	Demeton, O Naled Demeton, S Merphos	375.9 (50-150) 151.6 (50-150) 23.7 (50-150) 0.0 (50-150)		1BG2000100 4BGS000401 4BGS000411	J(detect)/None(non-detect) J(detect)/None(non-detect) J(detect)/UJ(non-detect) J(detect)/R(non-detect)
OPLCS0119S	Rtx5	Demeton, O Demeton, S Merphos	453.3 (50-150) 26.6 (50-150) 0.0 (50-150)		2BGS000201 2BGS000210 5BGS000501 5BGS000510 5BGC000510	J(detect)/None(non-detect) J(detect)/UJ(non-detect) J(detect)/R(non-detect)

IX. COMPOUND IDENTIFICATION

Form 1, the associated raw data, and the identification summary (Form 10) were reviewed and all compounds were undetected.

X. COMPOUND QUANTITATION AND REPORTED CRQLs

All sample results were checked against. The CRQLs of all samples were checked to make sure that they reflected all sample dilution, concentrations, split, clean-up activities, and dry weight factors. Compound quantitation and reported CRQLs met QC requirements.

XI. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

INTRODUCTION

This data review report covers 12 soil samples and 3 water samples listed on the cover page. The analyses were per EPA 418.1 in "Method for Chemical Analysis of Water and Wastes" EPA 600/4-79/020.

This review follows the approach of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. HOLDING TIME

All holding time requirements were met.

II. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

The correlation coefficients were greater than or equal to 0.995.

III. CONTINUING CALIBRATION

Not applicable since all samples were run the same day as initial calibration.

IV. BLANKS

The method blank analyses were performed at required frequencies. No contaminant was found in the method blanks.

The field blank analyses were performed at required frequencies. No contaminant was found in the field blanks.

V. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

One set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VI. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements.

VII. PARAMETER IDENTIFICATION

No raw data were reviewed.

VIII. QUANTITATION AND REPORTED CRQLs

No raw data were reviewed.

IX. FIELD DUPLICATES

One set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

X. OVERALL ASSESSMENT OF DATA

Data flags have been summarized at the end of the report.

TRPH by IR Method 418.1 Data Qualification Summary - Case N° FD1303

No data were qualified for this package.

E/A&H VALIDATION ADDENDUM

Validation Subcontractor: CKY Environmental Services, Inc.
Site Name: NAS Memphis, Millington, Tennessee
CTO and Subtask No.: 0094-04730
Laboratory: NET Atlantic, Inc.
Sample Delivery Group: FD1303
Matrix: Water
Samples: BG2T011195, BG2E011195, BG2F011195, BG5T011295,
001D011095
E/A&H Project Chemist: Charlene M. Thompson *cmj*

The above samples were identified as field blanks, trip blanks, rinsate blanks, and DI system blanks. Field-derived blanks were used with method blanks to assess possible cross-contamination of field investigative samples. No action was taken if compounds were detected in the method blanks associated with the field-derived blanks or if QC parameters were not met in the field-derived blanks. The field blanks were used to assess cross-contamination in investigative samples only.

The validator qualified compounds in these blanks based on various QA/QC parameters in several different fractions. CKY was told that the only purpose for the field QC was to assess cross-contamination in investigative samples. Therefore, E/A&H has removed the estimated qualifiers from the field QC.

INTRODUCTION

This data review report covers 21 water samples listed on the cover page. The analyses were per EPA Method 6010, 7421, 7841, 7060, 7470, 7740, and 9010 SW846, November 1986.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February, 1994).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified; and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this SDG. The review was based on QC data.

I. HOLDING TIME

All criteria for laboratory contractual holding times were met.

Metal analyses were requested for samples 1BGE032095, 1BGF032095, 1BGGMW01LF, and 1BGHMW01LF on C.O.C. but were not analyzed by the laboratory.

II. CALIBRATION

Calibration curves were analyzed at the required frequency and met QC requirements.

CRDL standards for ICP and AA were analyzed and reported as required.

The frequency and analysis criteria of the calibration curve, initial calibration verification (ICV), and continuing calibration verification (CCV) were met.

Instrument detection limits (Form X), inter-element corrections (Form XI A & B) and linear range analysis (Form XII) were performed at required frequency.

III. BLANKS

The required frequency and criteria for blank analyses were met.

No contaminant above IDL was detected in the initial, continuing calibration, and preparation blanks except for the following:

Element	IDL (µg/L)	Initial Calibration Blank (µg/L)	Continuing Calibration Blank (µg/L)	Preparation Blank (µg/L)	Field, Trip, or Other Blank (µg/L)	Action Level (5 x highest blank) in (µg/L)	Samples Affected
Cadmium	3.0	-4.2		-4.2		21.0	All
Calcium	20.0			20.24		101.2	All
Iron	10.0			20.83		104.15	All
Lead	2.0				2.0	10.0	003GGM06UF
Silver	3.0		-4.6	-3.3		23.0	All
Zinc	5.0				5.3	26.5	007GGM09MF 007GMW03LS 007GMW08LS 48GGMW04LF 48GGMW04LS 48GGMW04UF
Zinc	5.0				5.8	29.0	28GGMW02LF 28GGMW02LS 58GGMW05LF 58GGMW05LF 58GGMW05LS

The sample data are qualified according to the contaminants found in the method blank(s). The qualified data are listed as follows:

Sample	Compound	Reported Concentration (ug/L)	Modified Final Concentration (ug/L)
2BGGMW02LS	Cd	5.0	5.0U
003GGM06UF	Pb	5.1	5.1U
007GGM09MF	Zn	7.1B	7.1U
4BGGMW04UF	Zn	5.4B	5.4U
2BGGMW02LF	Zn	11.2B	11.2U
5BGGMW05LF	Zn	5.1B	5.1U

IV. ICP INTERFERENCE CHECK SAMPLE (ICS)

The frequency and criteria for analysis were met.

Results for the ICP analyses of solution AB fell within 20% of the true value.

V. LABORATORY CONTROL SAMPLE (LCS)

The frequency and criteria for analysis were met.

VI. DUPLICATE SAMPLE ANALYSIS

Frequency and criteria for analysis were met.

VII. MATRIX SPIKE SAMPLE ANALYSIS

Spiked sample analysis was performed as required. The percent recoveries were within advisory limits of 75-125% except for the following:

Analyte	MS %R	Associated Samples	Flag
Se	129.5% (75-125%)	All	J(detect)/None(non-detect)

VIII. FURNACE ATOMIC ABSORPTION QC

The samples/elements for duplicate injection have %RSD within 20.0% except for the following:

The analytical spike recoveries were within QC limit of 85-115% except for the following:

Sample	Element	%R	QC Limit	Flag
MW02LF	Se	138.5	85-115%	J(detect)/UJ(non-detect)
GMW02LS	Se	76	85-115%	J(detect)/UJ(non-detect)
GMW05LF	Se	127	85-115%	J(detect)/UJ(non-detect)
GMW05UF	Se	117	85-115%	J(detect)/UJ(non-detect)
GGMW09MF	Se	124.5	85-115%	J(detect)/UJ(non-detect)
GMW08LS	Se	121.5	85-115%	J(detect)/UJ(non-detect)
GMW04UF	Se	117.5	85-115%	J(detect)/UJ(non-detect)
MW03LS	Tl	80	85-115%	J(detect)/UJ(non-detect)
GGM06UF	Tl	56	85-115%	J(detect)/UJ(non-detect)
MW02LF	As	118.5	85-115%	J(detect)/UJ(non-detect)
GGM06UF	As	117	85-115%	J(detect)/UJ(non-detect)
GMW04LS	Tl	78.0	85-115%	J(detect)/UJ(non-detect)
MW02LF	Pb	124.8	85-115%	J(detect)/UJ(non-detect)
GMW05LF	Pb	116.5	85-115%	J(detect)/UJ(non-detect)
HMW05LF	Pb	117.8	85-115%	J(detect)/UJ(non-detect)
GMW04LS	Pb	76.2	85-115%	J(detect)/UJ(non-detect)
GMW05UF	Pb	175.5	85-115%	J(detect)/UJ(non-detect)
GGM09MF	Pb	158	85-115%	J(detect)/UJ(non-detect)

IX. ICP SERIAL DILUTION

The frequency and criteria for analysis were met.

% D for the following was out of QC limit:

Element	IDL (µg/L)	50 x IDL (µg/L)	Sample #		%D	Associated Samples	Flag
			1 (µg/L)	5 (µg/L)			
Barium	2.0	100	155.45	130.60	16.0	All	J(detect)/None(non-detect)

X. SAMPLE RESULTS VERIFICATION

No raw data were reviewed.

XI. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. All detected analytes were within QC limit.

XII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

INTRODUCTION

This data review report covers 22 water samples listed on the cover page. The analyses were per EPA Method 8240 in SW846.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993). The subsections correlate to the above guidelines. In the event that the SW846 requirement is different from that of the guidelines, the guideline QC limit will be replaced by the SW846 QC limit.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

Raw data checks were carried out for this SDG, the review was based on full documentation.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. GC/MS INSTRUMENT PERFORMANCE CHECK

Instrument performance check was carried out at 12-hour intervals.

All ion abundance requirements were met.

III. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

For all compounds and surrogates, percent relative standard deviations (%RSD) for RRF and relative response factors (RRF) met QC requirements.

IV. CONTINUING CALIBRATION

Continuing calibrations were run at the required frequency.

The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF and all of the continuing calibration RRF values met QC requirements except for the following:

Date/Time	Instrument	Compound	%D (SW846 QC Limit)	Associated Samples	Flag
03/25/95 / 11:23	HP5970K	Chloromethane 2-Hexanone	36.7 (± 25.0) 26.2 (± 25.0)	007GGM09MF 007GMW01LS 007GMW08LS	J(detect)/UJ(non-detect)
03/27/95 / 11:27	HP5970K	Acetone	28.0 (± 25.0)	003GGM06UF	J(detect)/UJ(non-detect)
03/24/95 / 10:36	HP5970K	Chloromethane	31.2 (± 25.0)	4BGGMW04LF 4BGGMW04LS 4BGGMW04UF	J(detect)/UJ(non-detect)

V. BLANKS

The method blank analyses were performed at required frequencies. No contaminants were found in the method blank(s) that resulted in data qualifications.

The field blank analyses were performed at required frequencies. Contaminants found in the field blank(s) that resulted in data qualifications are listed as follow:

Date	Blank	Compound	Concentration (ug/L)	Action Level (ug/L)		Samples Affected	Flag	Modified Final Concentration (ug/L)
				5 x	10 x			
03/20/95	5BGF031795	Acetone	8J		80	2BGGMW02LS 5BGGMW05LF 5BGGMW05LS	17 3J 3J	17U 10U 10U

Date	Blank	Compound	Concentration (ug/L)	Action Level (ug/L)		Samples Affected	Flag	Modified Final Concentration (ug/L)
				5 x	10 x			
03/20/95	5BGT031795	Acetone	12		120	2BGGMW02LS 5BGGMW05LF 5BGGMW05LS	17 3J 3J	17U 10U 40U

VI. SYSTEM MONITORING COMPOUNDS

System monitoring compounds were added to all samples and blanks as required by the SW846.

All system monitoring compound recoveries met QC requirements.

VII. MATRIX SPIKES/MATRIX SPIKE DUPLICATES

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Spiked Compound	MS %R (Limit)	MSD %R (Limit)	RPD (Limit)	Flag
2BGGMW02LF	Trichloroethene Benzene Toluene	127 (71-120) 134 (76-127)	131 (71-120) 144 (76-127) 133 (76-125)		J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)

VIII. LABORATORY CONTROL SAMPLES

LCS not required by SW846.

IX. REGIONAL QUALITY ASSURANCE AND QUALITY CONTROL

Not applicable.

X. INTERNAL STANDARDS

All internal standard areas and retention times met QC requirements.

XI. TARGET COMPOUND IDENTIFICATION

The RRT, mass spectra, and chromatograms of reported compounds were examined and evaluated. Target compound identification met QC requirements.

XII. COMPOUND QUANTITATION AND REPORTED CRQLs

All sample results were checked against raw data to verify the correct calculation. The CRQLs of all samples were checked to make sure that they reflected all sample dilution, concentrations, split, clean-up activities, and dry weight factors. Compound quantitation and reported CRQLs met QC requirements.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

The chromatograms and mass spectra in every sample and blank were examined to verify the reported TIC. Their quantitations were reported according to SW846. Tentatively identified compounds met QC requirements.

XIV. SYSTEM PERFORMANCE

The on-going data acquisition during the period following the Instrument Performance QC Checks (e.g. blanks, tuning, and calibration) was thoroughly evaluated. System performance met QC requirements.

XV. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. All detected analytes were within QC limit.

XVI. OVERALL ASSESSMENT OF DATA

Data flags have been summarized at the end of the report.

INTRODUCTION

This data review report covers 20 water samples listed on the cover page. The analyses were per EPA Method 8270 in SW846.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993). The subsections correlate to the above guidelines. In the event that the SW846 requirement is different from that of the guidelines, the guideline QC limit will be replaced by the SW846 QC limit.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this SDG. The review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. GC/MS INSTRUMENT PERFORMANCE CHECK

Instrument performance check was carried out at 12-hour intervals.

All ion abundance requirements were met.

III. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

For all compounds and surrogates, percent relative standard deviations (%RSD) for RRF and relative response factors (RRF) met QC requirements except for the following:

Date	Instrument	Compound	%RSD (SW846 QC Limit)	Associated Samples	Flag
02/21/95	HP5970F	Hexachlorocyclopentadiene	43.7 (< 30)	All	J(detect)/UJ(non-detect)

IV. CONTINUING CALIBRATION

Continuing calibrations were run at the required frequency.

The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF and all of the continuing calibration RRF values met QC requirements except for the following:

Date	Instrument	Compound	%D (SW846 QC Limit)	Associated Samples	Flag
03/28/95 14:13	HP5907F	2,4-Dinitrophenol 4-Nitrophenol Pentachlorophenol Benzo(k)fluoranthene Benzo(a)pyrene	32.9 (± 25.0) 40.1 (± 25.0) 30.2 (± 25.0) -28.2 (± 25.0) -27.6 (± 25.0)	007GGM09MF 007GMW08LS	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
03/29/95 13:43	HP5907F	2,4-Dinitrophenol 4-Nitrophenol Benzo(k)fluoranthene Benzo(a)pyrene	68.1 (± 25.0) 40.6 (± 25.0) 25.1 (± 25.0) -27.1 (± 25.0)	48GGMW04LF 48GGMW04LS 48GGMW04UF 28GGMW02LF 28GGMW02LS 58GGMW05LF 58GGMW05LS 58GGMW05UF	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
04/04/95 10:42	HP5907F	2,2-Oxybis(1-Chloropropane) 2,4-Dinitrophenol 4-Nitrophenol Benzo(k)fluoranthene	33.9 (± 25.0) 33.5 (± 25.0) 34.3 (± 25.0) -30.6 (± 25.0)	003GGM06UF	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)

V. BLANKS

The method blank analyses were performed at required frequencies. No contaminant was found in the method blank(s) that resulted in data qualifications.

The field blank analyses were performed at required frequencies. Contaminants found in the field blank(s) that resulted in data qualifications are listed as follow:

Date	Blank	Compound	Action Level (ug/L)		Samples Affected	Reported Concentration (x/x)	Modified Final Concentration (x/x)
			5 x	10 x			
03/29/95	2BGF031795	bis(2-ethylhexyl)phthalate	3J	30	5BGHMW05LF	3J	10U

VI. SURROGATE SPIKES

Surrogate spikes were added to all samples and blanks as required by the SW846.

All surrogate spike recoveries met QC requirements except for the following:

Sample	Surrogate Spike Compound	%R	QC Limit	Compounds Affected	Flag
2BGGMW02LF	2-Fluorophenol	6	21-110	All acid compounds	J(detect)/UR(non-detect)
	2,4,6-Tribromophenol	7	10-123		
	2-Chlorophenol-d4	26	33-110		

VII. MATRIX SPIKES/MATRIX SPIKE DUPLICATES

10 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Spiked Compound	MS %R (Limit)	MSD %R (Limit)	RPD (Limit)	Flag
2BGGMW02LF	2-Chlorophenol	10 (27-123)	16 (27-123)	46 (<40)	J(detect)/UJ(non-detect)
	Pentachlorophenol	7 (9-103)			

VIII. LABORATORY CONTROL SAMPLES

LCS not required by SW846.

IX. REGIONAL QUALITY ASSURANCE AND QUALITY CONTROL

Not applicable.

X. INTERNAL STANDARDS

All internal standard areas and retention times met QC requirements.

XI. TARGET COMPOUND IDENTIFICATION

No raw data were reviewed.

XII. COMPOUND QUANTITATION AND REPORTED CROLS

No raw data were reviewed.

XIII. TENTATIVELY IDENTIFIED COMPOUNDS

No raw data were reviewed.

XIV. SYSTEM PERFORMANCE

No raw data were reviewed.

XV. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XVI. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

INTRODUCTION

This data review report covers 20 water samples listed on the cover page. The analyses were per EPA Method 8080 in SW846, November 1986.

This review follows the approach of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified: and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. HOLDING TIME

All holding time requirements were met.

II. ANALYTICAL SEQUENCE

Standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

The retention time of TCX and DCB were within the QC limit.

III. INITIAL CALIBRATION

Initial calibration of single and multi-component analytes were performed for both columns.

The retention time windows for both columns were established according to the SW846 (Form 6D).

Peaks for multi-component analytes were properly identified (Form 6F).

The %RSDs for calibration factors of single component analytes for the primary column were within QC limits (Form 6E).

IV. CALIBRATION VERIFICATION

Calibration verifications were performed at required frequencies and sequence for both columns. %Ds for the primary column were within QC limit except for the following:

Date/ Time	Standard	Compound	%D Primary Column (XT-15)	%D Secondary Column (RTX35)	QC Limit	Associated Samples	Flag
03/30/95 1:20	INDBM10	Endrin Aldehyde	-18.37		± 15.0	4BGGMW04LS 4BGGMW04UF	J(detect)/UJ(non-detect)
03/31/95 15:29 17:59	1NDAM13 2NDBM13	Methoxychlor Endrin Aldehyde Endrin Ketone	-17.74 -21.53 -15.95		± 15.0 ± 15.0 ± 15.0	5BGGMW05LF 5BGGMW05LF 5BGGMW05LS 5BGGMW05UF 003GGM06UF	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)
04/01/95 1:13	1NDBM14	Endrin Aldehyde	-18.73		± 15.0	003GGM06UF	J(detect)/UJ(non-detect)

V. BLANKS

Instrument blank(s) was/were performed at the required frequency. RT windows were all within QC limit.

The method blank(s) was/were extracted and performed according to the SW846. No contaminant was found in the method blank(s) that resulted in data qualifications.

The field blank analyses were performed at required frequencies.

VI. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SW846. Surrogate spike recoveries were within QC limits.

VII. MATRIX SPIKES/MATRIX SPIKE DUPLICATES

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VIII. LABORATORY CONTROL SAMPLES

No laboratory control samples were reported for this SDG.

IX. COMPOUND IDENTIFICATION

Form I, and the identification summary (Form X) were reviewed and all compounds were properly identified.

X. FLORISIL CARTRIDGE CHECK

The %R for florisil cartridge check were within QC limits.

The florisil clean up was applied to all samples, blanks, MS, and MSD.

XI. COMPOUND QUANTITATION AND REPORTED CROLS

No raw data were reviewed.

XII. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XIII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

Organochlorine Pesticide/PCBs Data Qualification Summary - SDG N° FD1345

Water

INTRODUCTION

This data review report covers 20 water samples listed on the cover page. The analyses were per EPA Method 8140, SW846, November 1986.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993) as there are no current guidelines for evaluating chlorinated pesticides.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified; and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met except for the following:

Sample	Matrix	Date of Collection	Date of Extraction	Date of Analysis	Extraction Holding Time (QC Limit/Days)	Flag
007GMW08LSRE	Water	03/16/95	03/31/95	04/10/95	15(7)	J(detect)/UJ(non-detect)

007GMW08LSRE is a re-extracted sample. The data of the original sample was not included in this package. Therefore, whether or not data for the re-extracted sample should be used cannot be evaluated.

II. ANALYTICAL SEQUENCE

Standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

III. INITIAL CALIBRATION

Initial calibration of analytes were performed for both columns.

The %RSDs for calibration factors of single component analytes for the primary column were within QC limits (Form 6B) except for the following:

Date/Time	Standard/Column	Compounds	%RSD (RTX35) Primary Column	QC Limit	Samples Affected	Flag
03/23/95 00:05	RF250	Naled	20.2	+ 20.0	007GGM09MF	J(detect)/UJ(non-detect)
	RF500	Merphos	48.7	+ 20.0	4BGGMW04LF	J(detect)/UJ(non-detect)
	RF1000	Fensulfothion	23.6	+ 20.0	4BGGMW04LS	J(detect)/UJ(non-detect)
	RF2000	Guthion	34.1	+ 20.0	4BGGMW04UF	J(detect)/UJ(non-detect)
	RF4000				2BGGMW02LF 2BGGMW02LS 5BGGMW05LF 5BGGMW05LS 5BGGMW05UF 003GGM06UF	
04/04/95	RF250	Mevinphos, Alpha	28.3	+ 20.0	007GMW08LSRE	J(detect)/UJ(non-detect)
	RF500	Fensulfothion	31.9	+ 20.0		J(detect)/UJ(non-detect)
	RF1000	Guthion	26.5	+ 20.0		J(detect)/UJ(non-detect)
	RF2000 RF4000					

IV. CALIBRATION VERIFICATION

Calibration verifications were performed at required frequencies and sequence for both columns. %Ds for the primary column were within QC limit (Form 7B) except for the following:

Date/Time	Standard	Compound	%D Primary Column	QC Limit	Associated Samples	Flag

V. BLANKS

Instrument blank(s) was/were performed at the required frequency. No contaminant was found in the instrument blank(s) that resulted in data qualifications.

The method blank(s) was/were extracted and performed according to the SW846. No contaminant was found in the method blank(s) that resulted in data qualifications.

The field blank(s) was/were extracted and performed according to the SW846. No contaminant was found in the field blank(s) that resulted in data qualifications.

VI. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SW846. Surrogate spike recoveries were within QC limits.

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies.

Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Column	Compound	MS %R (Limits)	MSD %R (Limits)	RPD (Limit)	Flag
2BGGMW02LF	RTX35	Dichlorvos	160 (50-150%)	44 (50-150%)	114 (+15%)	J(detect)/UJ(non-detect)
		Mevinphos, A		39 (50-150%)	117 (+15%)	J(detect)/UJ(non-detect)
		Demeton, O	28 (50-150%)	9 (50-150%)	103 (+15%)	J(detect)/UJ(non-detect)

IX. COMPOUND IDENTIFICATION

Form 1, the associated raw data, and the identification summary (Form 10) were reviewed and all compounds were non-detected.

X. COMPOUND QUANTITATION AND REPORTED CRQLs

No raw data were reviewed.

XI. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XII. OVERALL ASSESSMENT OF DATA

Data flags have been summarized at the end of the report.

Organophosphorus Pesticides Data Qualification Summary - SDG N° FD1345

INTRODUCTION

This data review report covers 20 water samples listed on the cover page. The analyses were per EPA Method 8150, SW846, November 1986.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993) as there are no current guidelines for evaluating chlorinated pesticides.

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

Raw data checks were carried out for this SDG, the review was based on full documentation.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. ANALYTICAL SEQUENCE

Standards, blanks, and sample extracts were analyzed according to the required analytical sequence and frequency.

III. INITIAL CALIBRATION

Initial calibration of analytes were performed for both columns.

The %RSDs for calibration factors of single component analytes for the primary column were within QC limits (Form 6B) except for the following:

Date/Time	Standard/Column	Compounds	%RSD(RTX35)	QC Limit	Associated Samples	Flag
03/30/95 10:11	RF1X RF2X RF4X RF10X RF20X	MCPP DINOSEB	34.9 45.8	≤ 20.0%	All samples	J(detect)/UJ(non-detect)

IV. CALIBRATION VERIFICATION

Calibration verifications were performed at required frequencies and sequence for both columns. %Ds for the primary column were within QC limit (Form 7B) except for the following:

Date/Time	Standard/Column	Compound	%D Primary Column (RTX35)	QC Limits	Associated Samples	Flag
03/30/95 23:18	RF4X	MCPP MCPA	-26.3 -15.2	± 15.0%	007GGM09MF 007GMW08LS 48GGMW04LF 48GGMW04LS 48GGMW04UF 28GGMW02LF 28GGMW02LS 58GGMW05LF 58GHMW05LF	J(detect)/UJ(non-detect)
03/31/95 07:32	RF4X	MCPP	-21.3	± 15.0%	28GGMW02LF 28GGMW02LS 58GGMW05LF 58GHMW05LF 58GGMW05LS 58GGMW05UF	J(detect)/UJ(non-detect)
03/31/95 11:41	RF4X	DINOSEB	15.2	± 15.0%	58GGMW05LS 58GGMW05UF	J(detect)/UJ(non-detect)
04/01/95 04:19	RF4X	MCPP MCPA DINOSEB	-30.1 -16.8 -16.1	± 15.0%	003GGM06UF	J(detect)/UJ(non-detect) J(detect)/UJ(non-detect) J(detect)/UJ(non-detect)

V. BLANKS

Instrument blank(s) was/were performed at the required frequency. No contaminant was found in the instrument blank(s) that resulted in data qualifications.

The method blank(s) was/were extracted and performed according to the SW846. No contaminant was found in the method blank(s) that resulted in data qualifications.

The field blank(s) was/were extracted and performed according to the SW846. No contaminant was found in the field blank(s) that resulted in data qualifications.

VI. SURROGATE SPIKES

Surrogate spikes were analyzed as required by the SW846. Surrogate spike recoveries were within QC limits.

VII. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits except for the following:

Sample	Column	Compound	MS %R (Limits)	MSD %R (Limits)	RPD (Limit)	Flag
3GGMW02LF	RTX35	MCPP	14 (20-150%)	12 (20-150%)	22 (<20%)	J(detect)/UJ(non-detect)
		MCPA	16 (20-150%)	16 (20-150%)	22 (<20%)	
		2,4-DB	10 (20-150%)	7 (20-150%)	22 (<20%)	
		2,4-D				

VIII. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements.

IX. ESTERIFICATION SPIKE SAMPLE

Esterification spike samples were analyzed and met QC requirements.

X. COMPOUND IDENTIFICATION

Form 1, the associated raw data, and the identification summary (Form 10) were reviewed and all compounds were non-detects.

XI. COMPOUND QUANTITATION AND REPORTED CRQLs

All sample results were checked against raw data to verify the correct calculation. The CRQLs of all samples were checked to make sure that they reflected all sample dilution, concentrations, split, clean-up activities, and dry weight factors. Compound quantitation and reported CRQLs met QC requirements.

XII. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

XIII. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

INTRODUCTION

This data review report covers 20 water samples listed on the cover page. The analyses were per EPA 418.1 in "Method for Chemical Analysis of Water and Wastes" EPA 600/4-79/020.

This review follows the approach of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February, 1993).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data checks were carried out for this SDG, the review was based on QC data.

I. HOLDING TIME

All holding time requirements were met.

II. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

The correlation coefficients were greater than or equal to 0.995.

III. CONTINUING CALIBRATION

Not applicable because all analyses were done within the same day of initial calibration.

IV. BLANKS

The method blank analyses were performed at required frequencies. No contaminant was found in the method blank(s) that resulted in data qualifications.

The field blank analyses were performed at required frequencies. No contaminant was found in the field blank(s) that resulted in data qualifications.

V. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VI. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements.

VII. PARAMETER IDENTIFICATION

No raw data were reviewed.

VIII. QUANTITATION AND REPORTED CROLS

No raw data were reviewed.

IX. FIELD DUPLICATES

1 set of field duplicates was analyzed in this SDG. No target analytes were detected in any of the samples.

X. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

No data were qualified for this SDG.

INTRODUCTION

This data review report covers 3 water samples listed on the cover page. The analyses were per EPA Method 351.2, Method 335.2, and Method 365.3 in "Method for Chemical Analysis of Water and Wastes," EPA 600/4-79/020, Revised March 1983.

This review follows the approach of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February, 1994).

Definition of Qualifiers:

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of analyte that has been "tentatively identified; and the associated numerical value represents its approximate concentration.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

A table summarizing all data qualification flags is provided at the end of this report.

No raw data were checked for this SDG. The review was based on QC data.

I. TECHNICAL HOLDING TIME

All holding time requirements were met.

II. INITIAL CALIBRATION

Initial calibrations were performed using required standard concentrations. QC methodology and criteria were applied.

The correlation coefficients were greater than or equal to 0.995.

III. CONTINUING CALIBRATION

Continuing calibrations were run at the required frequency.

The percent difference (%D) between the initial calibration and the continuing calibration were within ± 15.0 percent.

IV. BLANKS

The method blank(s) was/were extracted and performed according to the SW846. The blanks were free of contamination.

No field blank was analyzed.

V. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

1 set of matrix spike (MS) and matrix spike duplicate (MSD) was analyzed at required frequencies. Spike recoveries and relative percent difference were within advisory limits.

VI. LABORATORY CONTROL SAMPLES

Laboratory control samples were analyzed and met QC requirements.

VII. PARAMETER IDENTIFICATION

No raw data were reviewed.

VIII. QUANTITATION AND REPORTED CROQLs

No raw data were reviewed.

IX. SYSTEM PERFORMANCE

Not applicable.

X. FIELD DUPLICATES

No field duplicates were analyzed for this SDG.

XI. OVERALL ASSESSMENT OF DATA

Field QC samples were used only to assess blank cross-contamination in the investigative samples.

Data flags have been summarized at the end of the report.

General Inorganic Data Qualification Summary - SDG N° FD1345

No data were qualified for this SDG.

DATA VALIDATION SUMMARY REPORT

COMPANY: Ensafe/Allen & Hoshall
SITE NAME: NAS Memphis
PROJECT NUMBER: 8500.024
CONTRACTED LAB: National Environmental Testing, Inc.
QA/QC LEVEL: Level III
EPA SOW/METHOD: EPA 1990 SOW
VALIDATION GUIDELINES: USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, 1994; USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, 1994

SAMPLE MATRIX: Water
TYPES OF ANALYSES: Volatile Organics (VOA), Semivolatile Organics (SVOA), Pesticides/PCB's (P/PCB), Total Metals and Cyanide (Me/CN), Total Petroleum Hydrocarbons (TPH), Herbicides (HERB), Organophosphorus Pesticides (OPPE), Alkalinity (ALK), Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total Kjeldahl Nitrogen (TKN), Total Phosphorus (P), Nitrate (N), Hardness (HD), Total Suspended Solids (TSS), Turbidity (TB)

SDG NUMBER: 1347

DATA REVIEWER(S): Amy L. Hogan, Marvin L. Smith

RELEASE SIGNATURE:

Data Qualifier Definitions:

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

NET, Inc. - 1347 Organics and Inorganics

SAMPLES: 003GGM01LS, 003GGM07UF, 003GGM08LS, 003GMW03LS, 003GMW03MF, 003GMW03MFDL, 003GMW03MFRE, 003HMMW03MF, 003HMMW03MFDL, 003HMMW03MFRE, 003GMW04LF, 003GMW04LFRE, 003GMW04LS, 003GMW04LSRE, 003GMW05MF, 003GMW05MFRE, 008GMW001F, 008GMW002F, 008GMW002FRE, 007GMW03LS, 007GMW01LS, 1BGGMW01LF, 1BGGMW01LFRE, 1BGHMW01LF, 1BGHMW01LFRE, 1BGGMW01LS, 1BGGMW01UF, 2BGGMW02UF, 003GMW01LSMS, 003GMW08LSD, 1BGT032095, 1BGF032095, 003T032195, 003T032295

VOLATILE ORGANICS

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) GC/MS Tuning:

All Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Relative Standard Deviations (%RSD's) of the following compounds exceeded the 30% QC limit for the initial calibration run on 3/23/95 on instrument HP5970H:

acetone	35.5%
2-butanone	42.0%

The positive results for acetone in the associated samples (all samples for this SDG) were flagged as estimated (J). There were no positive results for 2-butanone in the associated samples. No further action was required.

Continuing Calibration:

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 3/26/95 at 08:30 on instrument HP5970H:

chloromethane	46.7%
bromomethane	31.6%
vinyl chloride	30.3%
2-hexanone	27.3%

The results for these compounds in associated samples 003GGM01LS, 003GGM08LS, 003GMW03MF, 003HMMW03MF, 003GMW05MF, 008GMW001F and 008GMW002F, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Differences (%D'S) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 3/27/95 at 12:14 on instrument HP5970K:

chloromethane	38.8%
vinyl chloride	28.6%
acetone	30.3%
2-butanone	34.4%
4-methyl-2-pentanone	37.1%
2-hexanone	40.7%

The positive and non-detect results for these compounds in associated samples 1BGGMW01LF, 1BGHMMW01LF, 1BGGMW01UF and 2BGGMW02UF were flagged as estimated (J) and (UJ).

IV.) Blanks:

Method Blanks:

Acetone was detected at 9.0 ug/L in water method blank VBLK032695H. The positive results for this compound in associated samples 003GGM01LS, 003GGM08LS, 003GMW03MF, 003GMW05MF, 003HMMW03MF, 008GMW001F and 008GMW002F less than 10X the blank were flagged as undetected (U) with the detection limit being raised to the level of contamination in each sample.

Methylene chloride was detected at 2.0 ug/L in water method blank VBLK032795K. There were no positive results for this compound in the associated samples. No action was required.

Methylene chloride was detected at 1.0 ug/L in water method blank VBLK033095K. There were no positive results for this compound in the associated samples. No action was required.

Trip Blanks and Equipment Blanks:

Acetone was detected at 6 ug/L in trip blank 003T032295. The associated samples were previously qualified using the method blank. No further action was required.

Acetone, 2-butanone and chlorobenzene were detected at 7 ug/L, 17 ug/L and 1 ug/L, respectively, in field blank 1BGF032095. The associated positive detections of acetone below 10X the blank contamination were flagged as undetected (U) with the detection limit being raised to the level of contamination in each sample. There were no associated positive sample results for the other compounds, so no further action was required. The associated samples were 1BGGMW01LS, 1BGHMMW01LF and 1BGGMW01LF.

TIC's:

There were no TIC's reported in the method blanks for this SDG.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

There were no MS / MSD analyses requested for this SDG. No action was required.

VII.) Field Duplicates:

The Relative Percent Differences (RPD's) of ethylbenzene (67%) and xylene (44%) exceeded the 30% QC limit for field duplicate samples 003GMW03MF and 003HMW03MF. The results for these compounds in the two samples were flagged as estimated (J).

The RPD of acetone (9.5%) was within the 30% QC limit for field duplicate samples 1BGGMW01LF and 1BGHMW01LF. No action was required.

VIII.) Internal Standards Performance:

All Internal Standards Performance criteria were met. No action was required.

IX.) TCL Compound Identification:

All TCL criteria were met, so no action was necessary.

X.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL's):

All CRQL criteria were met. No action was required.

XI.) Tentatively Identified Compounds (TIC's):

All TIC criteria were met, so no action was taken.

XII.) System Performance:

All criteria were met, so no action was necessary.

XIII.) Overall Assessment of Data/General:

All remaining laboratory data were acceptable with qualification.

SEMIVOLATILE ORGANICS

I.) Holding Times:

The number of days between sample date and extraction date exceeded the 14 day QC limit for the following samples:

003GGM07UF	20
003GMW03MFRE	29
003HMW03MFRE	29
003GMW04LFRE	30
003GMW04LSRE	30
003GMW05MFRE	29
008GMW002FRE	29
1BGGMW01LFRE	31
1BGHMW01LFRE	31

The results for sample 003GGM07UF, which consisted entirely of non-detects, were flagged as estimated (UJ). The results for the other samples were rejected (R) since the number of days exceeded the QC limit by more than 2X.

II.) GC/MS Tuning:

All GC/MS Tuning criteria were met, so no action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Relative Standard Deviation (%RSD) of hexachlorocyclopentadiene (43.7%) exceeded the 30% QC limit for the initial calibration run on 2/21/95 on instrument HP5970F. There were no positive results for this compound in the associated samples. No action was required.

Continuing Calibration:

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/10/95 at 17:01 on instrument HP5970F:

2,2'-oxybis(1-chloropropane)	28.2%
4-chloroaniline	70.1%
2-methylnaphthalene	38.4%
4-nitrophenol	29.0%
n-nitrosodiphenylamine	74.6%

All results for these compounds in associated samples 1BGGMW01LF, 1BGHMW01LF, 1BGGMW01UF, 2BGGMW02UF, 007GMW03LS, 003GMW03LS, 003GMW04LF, 003GMW04LS, 1BGGMW01LS, 003GGM01LS, 003GMW08LS, 003HMW03MF, 003GMW05MF and 008GMW001F, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/12/95 at 11:05 on instrument HP5970F:

2,2'-oxybis(1-chloropropane)	30.5%
n-nitroso-di-n-propylamine	25.3%
2,4-dimethylphenol	25.0%
4-chloroaniline	71.4%
2-nitroaniline	32.7%
4-nitrophenol	37.7%
n-nitrosodiphenylamine	75.9%

The results for these compounds in associated samples 008GMW002F and 003GMW03MF, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Difference (%D) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/20/95 at 15:36 on instrument HP5970F:

2,4-dinitrophenol	26.1%
4-nitrophenol	26.1%

The results for these compounds in associated sample 003GGM07UF, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/26/95 at 11:09 on instrument HP5970J:

bis (2-chloroethyl)ether	25.9%
2,2'-oxybis(1-chloropropane)	67.4%
2,6-dinitrotoluene	29.4%
3-nitroaniline	25.8%
4-nitrophenol	28.6%
2,4-dinitrotoluene	32.0%
4-nitroaniline	25.2%

The results for these compounds in the associated samples were previously rejected based on holding times. No further action was necessary.

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/24/95 at 13:57 on instrument HP5970J:

2,2'-oxybis(1-chloropropane)	50.4%
2,4-dinitrophenol	26.1%
4-nitrophenol	36.6%
4,6-dinitro-2-methylphenol	43.2%

The results for these compounds in the associated samples were previously rejected based on holding times. No further action was required.

IV.) Blanks:

Method Blanks:

All Method Blank criteria were met. No action was required.

Field Blanks:

There were no positive detections in the field blanks associated with this SDG. No action was required.

V.) Surrogate Recoveries:

The Percent Recoveries (%R's) of 2-fluorophenol (6%) and 2-chlorophenol (14%) were below their respective 21-110% and 33-110% QC limits in sample 003GMW03MFRE. All results for this sample were previously rejected. No further action was necessary.

The Percent Recoveries (%R's) of the following compounds were below their respective QC limits for sample 003GMW03MF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	9	21-110
2,4,6-tribromophenol	7	10-123
2-chlorophenol	20	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely on non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their respective QC limits for sample 003GMW04LF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	8	21-110
2,4,6-tribromophenol	9	10-123
2-chlorophenol	20	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 003GMW04LFRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	3	21-110
2,4,6-tribromophenol	5	10-123
2-chlorophenol	11	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their respective QC limits for sample 003GMW04LS:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	5	21-110
2,4,6-tribromophenol	6	10-123
2-chlorophenol	21	33-110

Since the %R of two of the surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R). The reanalysis passed all Surrogate Recovery criteria.

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 003GMW05MF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	1	21-110
2,4,6-tribromophenol	0	10-123
2-chlorophenol	6	33-110

Since the %R of three surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 003GMW05MFRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	1	21-110
2,4,6-tribromophenol	3	10-123
2-chlorophenol	6	33-110

Since the %R's of three surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, would have been rejected (R). All results for this sample were previously rejected due to holding time exceedance. No further action was required.

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 003HMMW03MF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	7	21-110
2,4,6-tribromophenol	4	10-123
2-chlorophenol	17	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 003HMW03MFRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	1	21-110
2,4,6-tribromophenol	2	10-123
2-chlorophenol	4	33-110

Since the %R's of three surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, would have been rejected (R). All results for this sample were previously rejected due to holding time exceedance. No further action was required.

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 008GMW002F:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	9	21-110
2,4,6-tribromophenol	3	10-123
2-chlorophenol	22	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 008GMW002FRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	1	21-110
2,4,6-tribromophenol	4	10-123
2-chlorophenol	6	33-110

Since the %R's of three surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, would have been rejected (R). All results for this sample were previously rejected due to holding time exceedance. No further action was required.

The Percent Recovery (R) of terphenyl-d14 (20%) was below the 33-141% QC limits for sample 007GMW03LS. Since only one surrogate failed, no action was required.

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 1BGGMW01LF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	3	21-110
2,4,6-tribromophenol	0	10-123
2-chlorophenol	11	33-110

Since the %R of three surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 1BGGMW01LFRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	4	21-110
2,4,6-tribromophenol	8	10-123
2-chlorophenol	18	33-110

Since the %R's of two surrogates were less than 10%, the acid fraction results for this sample, which consisted entirely of non-detects, would have been rejected (R). All results for this sample were previously rejected due to holding time exceedance. No further action was required.

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 1BGHWMW01LF:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	2	21-110
2,4,6-tribromophenol	3	10-123
2-chlorophenol	9	33-110

Since the %R's of three surrogates were less than 10%, the results for this sample, which consisted entirely of non-detects, were rejected (R).

The Percent Recoveries (%R's) of the following compounds were below their QC limits for sample 1BGHWMW01LFRE:

<u>Compound</u>	<u>%R</u>	<u>QC limits</u>
2-fluorophenol	5	21-110
2-chlorophenol	20	33-110

The results for this sample were previously rejected (R). No further action was taken.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

There were no MS / MSD analyses required for this SDG. No action was required.

VII.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate pairs 003GMW03MF / 003HWMW03MF and 1BGGMW01LF \ 1BGHWMW01LF. No action was required.

VIII.) Internal Standards Performance:

All Internal Standard Performance criteria were met. No action was required.

IX.) TCL Compound Identification:

All TCL criteria were met, so no action was required.

X.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL's):

All CRQL criteria were met, so no action was required.

XI.) Tentatively Identified Compounds (TIC's):

All TIC criteria were met, so no action was taken.

XII.) System Performance:

All criteria were met, so no action was necessary.

XIII.) Overall Assessment of Data/General:

The results for the 7 reanalysis samples were rejected due to Holding Time exceedances. The results for 14 samples (original and reanalyses) were rejected due to two or more surrogate %R's in each sample being below the 10% QC limit. The results for the associated field blank were not reported on the database. All other data were acceptable with qualification.

PESTICIDES/PCB's

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Instrument Performance:

All Instrument Performance criteria were met. No action was required.

III.) Calibration:

All Calibration criteria were met. No action was required.

IV.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

Field Blanks:

There were no positive detections in the field blanks associated with this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

There were no MS / MSD analyses requested for this SDG. No action was required.

VII.) TCL Compound Identification:

Pesticide/PCB Identification Summary (PIS):

All PIS criteria were met. No action was required.

VIII.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate sample pairs 003GMW03MF / 003HMW03MF and 1BGGMW01LF / 1BGHMW01LF. No action was required.

IX.) Pesticide Cleanup Check:

Florisil Cartridge Check:

All criteria were met, so no action was taken.

Gel Permeation Chromatography (GPC):

All GPC criteria were met, so no action was necessary.

X.) Overall Assessment of Data/General:

The results for the field blank samples associated with this SDG were not on the database. All other data were acceptable without qualification.

ORGANOPHOSPHORUS PESTICIDES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Instrument Performance:

All Instrument Performance criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Relative Standard Deviation (%RSD) of the following compounds exceeded the 20% QC limit for the initial calibration run on 4/05/95.

alpha mevinphos	28.3%
fensulfothion	31.9%
guthion	26.5%

The non-detect results for these compounds in all associated samples were flagged as estimated (UJ).

Continuing Calibration:

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/06/95 at 03:35:

merphos	38.4
coumophos	80.4

The results for these compounds in associated samples 003GMW03MF, 008GMW001F, 007GMW03LS, 1BGGMW01LF, 1BGHMW01LF, 1BGGMW01LS, 1BGGMW01UF, 2BGGMW02UF and 003GMW04LF, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/07/95 at 12:20:

dichlorvos	44.2
alpha mevinphos	67.5
o,demeton	43.0
ethoprop	39.5
naled	38.8
phorate	37.5
s,demeton	45.3
diazinon	53.5
disulfoton	36.6
chlorpyrifos	57.0
trichloronate	29.7
merphos	94.0
tokuthion	34.8
sulprofos	28.9
methyl parathion	48.7
ronnel	46.1
fenthion	40.2
fensulfothion	53.6
stirophos	48.3
coumophos	159

The results for these compounds in associated samples 003GMW04LF, 003GMW04LS, 003GMW05MF, 008GMW001F, 008GMW002F, 003GMW01LS, 003GMW07UF, 003GMW08LS, 003GMW03LS, 003GMW03MF, 003HMMW03MF, 1BGGMW01LS and 2BGGMW02UF, which consisted entirely of non-detects were flagged as estimated (UJ).

The Percent Differences (%D's) of the following compounds exceeded the 25% QC limit for the continuing calibration run on 4/07/95 at 15:13:

merphos	25.4
coumophos	73.1

The results for these compounds in associated samples 003GMW04LS, 003GMW01LS, 003GGM08LS, 003HMMW03MF, 003GMW05MF and 008GMW002F, which consisted entirely of non-detects, were flagged as estimated (UJ).

IV.) Blanks:

Method Blanks:

All Method Blank criteria were met. No action was required.

Field Blanks:

There were no positive detections in the field blanks associated with this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria for the method was met. No action was required.

VI.) Laboratory Control Sample

The Percent Recoveries (%R's) of the following compounds were below the 40-150% QC limit for LCS0325A:

naled	21.3%
merphos	36.9%

All results for these compounds in the associated samples, which consisted entirely of non-detects, were previously flagged based on the associated continuing calibrations. No further action was necessary.

The Percent Recoveries of the following compounds were below the 40-150% QC limits for sample LCS0328A:

o,demeton	32.1%
naled	39.3%
merphos	32.7%

All results for these compounds in the associated samples, which consisted entirely of non-detects, were

previously flagged based on the associated continuing calibrations. No further action was necessary.

VII.) Matrix Spike/Matrix Spike Duplicate (MS / MSD):

There were no MS / MSD analyses was requested for this SDG. No action was required:

VIII.) TCL Compound Identification:

The column Percent Difference (%D) for naled (415%) for sample 003GMW04LS exceeded the 70% QC limit. Since the %D exceeded 300%, the result for this compound was rejected (R).

IX.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate sample pairs 003GMW03MF / 003HMMW03MF and 1BGGMW01LF / 1BGHMMW01LF. No action was required.

X.) Overall Assessment of Data/General:

One result for naled was rejected due to a high PIS %D (>300%). All remaining data were acceptable with qualification.

HERBICIDES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Instrument Performance:

All Instrument Performance criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Relative Standard Deviations (%RSD's) of the following compounds exceeded the 20% QC limit for the initial calibration run on 3/30/95:

MCP	34.9%
dinoseb	45.8%

Since there were no positive results for these compounds in the associated samples, no action was taken.

Continuing Calibration:

The Percent Difference (%D) of MCP (30.1%) exceeded the 25% QC limit for the continuing calibration run on 4/01/95 at 04:19. The results for this compound in associated samples 003GGM07UF,

003GMW04LF, 003GMW05MF, 003GMW04LS, 007GMW01LS, 007GMW03LS, 008GMW001F, 1BGGMW01LF, 1BGHMW01LF, 1BGGMW01LS, 1BGGMW01UF and 2BGGMW02UF, which consisted entirely of non-detects, were flagged as estimated (UJ).

IV.) Blanks:

Method Blanks:

All Method Blank criteria were met. No action was required.

Field Blanks:

There were no positive detections in the field blanks associated with this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Matrix Spike/Matrix Spike Duplicate (MS / MSD):

There were no MS / MSD analyses requested for this SDG. No action was required.

VII.) LCS Recoveries:

The Percent Recovery (%R) of MCP (154%) exceeded the 10-150% QC limits for LCS sample ESTSPK0403. Since there were no positive results for this compound in the associated samples, no action was necessary.

The Percent Recovery (%R) of 2,4,5-T (160%) exceeded the 10-150% QC limits for LCS HLCS0329A. Since there were no positive detections of this compound in the associated samples, no action was required.

VIII.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

IX.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate sample pairs 003GMW03MF / 003HMF03MF and 1BGGMW01LF / 1BGHMW01LF. No action was required.

X.) Overall Assessment of Data/General:

All other data were acceptable with qualification.

TOTAL METALS and CYANIDE

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was required.

III.) Blanks:

The following blank results represent the highest detections associated with the samples and were used for data qualification:

<u>Blank</u> <u>Type/ID#</u>	<u>Element</u>	<u>Max. Conc.</u>	<u>Action Level</u> <u>ug/L</u>
PB	calcium	150 ug/L	750
PB	iron	15.0 ug/L	75.0
PB	magnesium	55.5 ug/l	278
CCB2	selenium	2.20 ug/L	11.0

PB = Preparation Blank, CCB = Continuing Calibration Blank

All results greater than the IDL but less than 5X the blank amount (Action Level, ug/L for water samples) for which the contaminated blank is an associated calibration or preparation blank were flagged as undetected (U).

The following analyte had a negative result with absolute values greater than the IDL:

<u>Blank</u> <u>Type/ID#</u>	<u>Analyte</u>	<u>Neg. Conc.</u>	<u>5X Conc. (ug/L)</u>
CCB2	arsenic	-2.60 ug/L	13.0

CCB = Continuing Calibration Blank

All associated positive sample results less than 5X the absolute value of the negative blank result were flagged as estimated (J) and all non-detects were flagged as estimated (UJ).

IV.) ICP Interference Check Sample Results:

All Interference Check Sample criteria were met. No action was required.

V.) ICP Serial Dilution Analysis:

All Serial Dilution criteria were met, so no action was necessary.

VI.) Laboratory Control Samples (LCS):

All Laboratory Control Sample criteria were met. No action was required.

VII.) Duplicate Sample Analysis:

All Duplicate Sample criteria were met. No action was necessary.

VIII.) Matrix Spike Recoveries:

The Percent Recovery (%R) of iron (13.7%) was below the 75-125% QC limits for spiked sample 003GGM01LSS. Since the %R was below 30% and all iron results were positives, associated samples 003GMW03MF, 003GMW04LF, 003GMW04LS and 008GMW001F were flagged as estimated (J).

IX.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate sample pairs 003GMW03MF / 003HMMW03MF and 1BGGMW01LF / 1BGHMMW01LF. No action was necessary.

X.) Furnace Atomic Absorption QC:

All GFAA criteria were met. No action was required.

XI.) Sample Result, Calculation/Transcription Verification:

All criteria were met, so no action was taken.

XII.) Quarterly Verification of Instrumental Parameters:

All criteria met, so no action was taken.

XIII.) Overall Assessment of Data/General:

All laboratory data were acceptable with qualification.

TOTAL PETROLEUM HYDROCARBONS

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no calculable RPD's in the field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

ALKALINITY

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

V.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VI.) Field Duplicates:

There were no field duplicates associated with this SDG.

VII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

BIOCHEMICAL OXYGEN DEMAND

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) Field Duplicates:

There were no field duplicates associated with this SDG.

VII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

CHEMICAL OXYGEN DEMAND

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

TOTAL KJELDAHL NITROGEN

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

TOTAL PHOSPHORUS

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks: -

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

TOTAL SUSPENDED SOLIDS

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

HARDNESS

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

NITRATE

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was necessary.

III.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

V.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VI.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicates associated with this SDG.

VIII.) Overall Assessment of Data/General:

All data were acceptable without qualification.

TURBIDITY

I.) Holding Times:

All samples were extracted and analyzed within required holding times. No action was required.

II.) Instrument Performance:

All Instrument Performance criteria were met. No action was necessary.

III.) Calibration:

All Calibration criteria were met. No action was necessary.

IV.) Blanks:

Method Blanks:

There were no positive detections in the method blanks, so no data qualification was necessary.

V.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met, so no action was necessary.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was necessary.

VII.) TCL Compound Identification:

All Compound Identification criteria were met. No action was required.

VIII.) Field Duplicates:

There were no field duplicates associated with this SDG.

IX.) Overall Assessment of Data/General:

All data were acceptable without qualification.

DATA REVIEWER(S): Amy L. Hogan, Marvin L. Smith

RELEASE SIGNATURE:

Data Qualifier Definitions:

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

VOLATILE ORGANICS

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) GC/MS Tuning:

All Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Relative Standard Deviation (%RSD) for acetone (67.5%) exceeded the 30% QC limit for the initial calibration run on 5/04/95. The positive results for this compound in associated samples 007GMW07LF, 007GMW07LS, 007GMW07UF, 007GMW08LF, 007GMW08UC, 007GMW08UF, 007GMW09LF, 007GMW09UC, 007GMW09UF, 007GMW04UC, 007GMW04UF, 007GMW05LF, 007GMW05UC and 007GMW07UC were flagged as estimated (J). The result for this compound in associated sample 007T050295 was a non-detect. No further action was required.

Continuing Calibration:

The Percent Difference (%D) of acetone (55.5%) exceeded the 25% QC limit for the continuing calibration run on 5/06/95 at 09:05. The non-detect results for this compound in associated samples 007GMW07LF, 007GMW07LS, 007GMW07UF, 007GMW08LF, 007GMW08UC, 007GMW08UF, 007GMW09LF, 007GMW09UC and 007GMW09UF were flagged as estimated (UJ). The positive results for this compound in the associated samples were previously flagged based on the initial calibration. The results for associated blank 007T050295 were not present on the spreadsheet for this SDG. No further action was necessary.

The Percent Difference (%D) of acetone (52.4%) exceeded the 25% QC limit for the continuing calibration run on 5/07/95 at 07:13. The non-detect results for this compound in associated samples 007GMW04UC, 007GMW04UF, 007GMW05LF, 007GMW05UC and 007GMW07UC were flagged as estimated (UJ). The positive results for this compound in the associated samples were previously flagged based on the initial calibration.

IV.) Blanks:

Method Blanks:

Acetone was detected at 10.0 ug/L in water method blank VBLK051295K. There were no positive results for this compound in associated samples 007GMW04LF and 007GMW05LS. No action was required.

Trip Blanks and Equipment Blanks:

Methylene chloride was detected at 2.0 ug/L in trip blank 006T050395. All positive results for this compound in associated samples 007GMW04LF, 007GMW04UC, 007GMW04UF, 007GMW05LF, 007GMW05LS, 007GMW05UC, 007HWM05UC and 007GMW05UF less than 10X the blank amount were flagged as undetected (U) with the detection limit being raised to the level of contamination in each sample.

There were no positive detections in trip blank 007T050295. No further action was required.

TIC's:

There were no TIC's reported in the method blanks for this SDG.

V.) Surrogate Recoveries:

The Percent Recovery (%R) of bromofluorobenzene (80%) in sample 007GMW05UFMS was below the 86-115% QC limits. Since the sample was a matrix spike and all other QC criteria were met, no action was taken.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

All MS / MSD criteria were met. No action was required.

VII.) Field Duplicates:

There were no calculable Relative Percent Differences (RPD's) for field duplicate samples 007GMW05UC and 007HWM05UC. No action was required.

VIII.) Internal Standards Performance:

All Internal Standards Performance criteria were met. No action was required.

IX.) TCL Compound Identification:

All TCL criteria were met, so no action was necessary.

X.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL's):

All CRQL criteria were met. No action was required.

XI.) Tentatively Identified Compounds (TIC's):

All TIC criteria were met, so no action was taken.

XII.) System Performance:

All criteria were met, so no action was necessary.

XIII.) Overall Assessment of Data/General:

The results for 006T050395 and 007T050295 were not in the spreadsheet for this SDG. All laboratory data were acceptable with qualification.

007GMW01UFMS, 007GMW01UFMSD

VOLATILE ORGANICS

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) GC/MS Tuning:

All Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

All Initial Calibration criteria were met. No action was required.

Continuing Calibration:

The Percent Difference (%D) of chloromethane (30.1%) exceeded the 25% QC limit for the continuing calibration run on 5/13/95 at 10:20. The results for this compound in associated samples BG5GMW05LF, BG5HMW05LF, BG5GMW05UF, 007GMW01UF, 007GMW02UC, 007GMW03LS and 007GMW69LF, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Difference (%D) of chloromethane (25.6%) exceeded the 25% QC limit for the continuing calibration run on 5/15/95 at 10:48. The results for the associated blanks 002E050495 and TRIP BLANK were not on the spreadsheet for this SDG. No action was taken.

IV.) Blanks:

Method Blanks:

Acetone was detected at 10.0 ug/L in water method blank VBLK051295K. There were no positive results for this compound in associated samples 007GMW01LS and 007GMW01LF. No action was required.

Trip Blanks and Equipment Blanks:

Methylene chloride was detected at 1.0 ug/L in the trip blank. There were no positive results for this compound in the associated samples. No action was necessary.

Acetone and methylene chloride were detected at 190 ug/L and 1.0 ug/L, respectively, in equipment blank 001E050495. All positive results for these compounds in the samples in this SDG less than 10X the blank amounts were flagged as undetected (U) with the detection limit being raised to the level of contamination in each sample.

There were no positive detections in blanks 002E050495 and FIELD BLANK. No further action was required.

TIC's:

There were no TIC's reported in the method blanks for this SDG.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met, so no action was taken.

VI.) Matrix Spike / Matrix Spike Duplicate (MS/MSD):

All MS / MSD criteria were met. No action was required.

VII.) Field Duplicates:

The Relative Percent Difference (RPD) for tetrachloroethene (3.6%) was within the 60% QC limit for soil field duplicate samples BG5GMW05LF and BG5HMW05LF. No action was required.

VIII.) Internal Standards Performance:

All Internal Standards Performance criteria were met. No action was required.

IX.) TCL Compound Identification:

All TCL criteria were met, so no action was necessary.

X.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL's):

All CRQL criteria were met. No action was required.

XI.) Tentatively Identified Compounds (TIC's):

All TIC criteria were met, so no action was taken.

XII.) System Performance:

All criteria were met, so no action was necessary.

XIII.) Overall Assessment of Data/General:

The results for 001E050495, 002E050495, FIELD BLANK and TRIP BLANK were not in the spreadsheet for this SDG. All remaining laboratory data were acceptable with qualification.

E/A&H VALIDATION SUMMARY REPORT

Site Name: NAS Memphis, Millington, Tennessee
CTO and Subtask No.: 0094-04730
Laboratory: NET Atlantic, Inc.
Sample Delivery Group: 1436
Matrix: Soil and Water

Samples and Analysis:

Sample ID	VOA
007C002812	X
007C002712	X
007C002512	X
007H002437	X
007H002544	X
007H002936	X

VALIDATION RESULTS

All samples were received by the laboratory intact and with the proper documentation on June 3, 1995. The following section summarizes the data validation results. Tentatively identified compounds have not been discussed in great detail, because most compounds are quantitatively uncertain (many TICs are unidentifiable and are reported as unknowns).

Volatile Organic Compound Fraction

1. All holding times were acceptable. A matrix spike/matrix spike duplicate, and field duplicate were not analyzed for this SDG. No problems were encountered during review of sample result verification.
2. Sample 007C002812 was analyzed outside the 12-hour QC requirements for the bromofluorobenzene (BFB) GC/MS instrument performance check. The sample was reanalyzed within the 12-hour QC requirements. Sample 007C002812RE will be used for investigative interpretation.
3. In the initial calibration, acetone had a %RSD outside acceptable criteria but no positive results were affected. The undetected results were not flagged because the %Ds were less than 50%.
4. In the continuing calibrations, several compounds had %Ds outside acceptable criteria, but no positive results were affected. The undetected results were not flagged because the %D was less than 50%.

5. Five method blanks were analyzed with this SDG. Methylene chloride was detected in the blanks at concentrations ranging from 10 $\mu\text{g}/\text{kg}$ to 40 $\mu\text{g}/\text{kg}$ and 20 $\mu\text{g}/\text{l}$. 4-Methyl-2-pentanone and bromomethane were detected in one blank each at concentrations of 10 $\mu\text{g}/\text{Kg}$ and 10 $\mu\text{g}/\text{l}$, respectively. 2-Hexanone was detected in one blank at a concentration on 30 $\mu\text{g}/\text{Kg}$. As a result, methylene chloride, bromomethane, 4-methyl-2-pentanone, and 2-hexanone detected in all investigative samples were negated due to laboratory contamination.
6. The surrogate 1,2-dichloroethane- d_4 exceeded the upper QC requirements in samples 007C002712 and 007C002812RE. All positive results in these two samples were qualified at estimated (J). Sample 007C002712 was re-analyzed and the surrogate was within the QC requirements. Sample 007C002712RE was used for investigative interpretation.
7. The internal standards bromochloromethane, 1,4-difluorobenzene, and chlorobenzene- d_5 exceeded the QC requirements in samples 007C002512 and 007C002712 while 1,4-difluorobenzene and chlorobenzene- d_5 exceeded the QC requirements in sample 007C002812. The samples were re-analyzed, with the only improvement appearing in bromomethane. Because only two internal standards exceeded the QC requirements in the re-analyses, the re-analyzed samples were used for investigative interpretation.

DISCUSSION OF DIELDRIN RISK MANAGEMENT ISSUES

DISCUSSION OF DIELDRIN RISK MANAGEMENT ISSUES

Chlorinated pesticides (specifically dieldrin) were used extensively in the 1950s and 1960s during a white fringed beetle quarantine. NAS Memphis has record that the agents were applied aerially for their intended purpose over the majority of the base. During the RCRA Facility Investigation, dieldrin and other chlorinated pesticides were detected in most surface soil and some vadose soil samples collected at specific SWMUs and background locations. Due to the ubiquitous presence of dieldrin in site soils, the following assessment was performed to support risk management decisions to be made by the BCT.

Figure 1 shows reported surface (0-1 ft.) soil dieldrin concentrations across the northern portion of the base. As shown in the figure, levels at SWMUs ranged from below quantitation limits to 609 $\mu\text{g}/\text{kg}$ (average of duplicate results at SWMU 5, boring 4). At background locations, concentrations ranged from below quantitation limits to 311 $\mu\text{g}/\text{kg}$ with a mean of 131 $\mu\text{g}/\text{kg}$.

In order to provide an evaluation of the significance of the reported levels, standard risk assessment methods were employed. Default assumptions for residential and occupational exposure scenarios were used to project dieldrin-related carcinogenic risk through incidental ingestion and dermal contact soil pathways. For each exposure scenario, risk was computed using the maximum and mean SWMU-specific dieldrin concentrations. The results of this process are provided in the attached table.

As shown in the table, SWMU 5 had the highest projected soil pathway risk associated with dieldrin at maximum concentrations ($2.2\text{E}-5$). The SWMU 5 risk estimate was approximately twice that of the corresponding background. When mean concentrations were used as the exposure point concentration, SWMU 8 dieldrin risk was found to be the highest although it did not differ appreciably from background. In no instance (onsite or background) did dieldrin risk projections exceed $1\text{E}-4$. This finding indicates that dieldrin levels found at each SWMU do not necessitate remedial action in the absence of other significant carcinogenic risk contributors. USEPA's generally acceptable range for carcinogenic risk is $1\text{E}-4$ to $1\text{E}-6$.

Soil dieldrin is not expected to pose a substantial threat to shallow groundwater at any SWMU or background location. This conclusion is based on the strong soil binding properties of the compound as well as empirical data for vadose soils which show no significant vertical migration has occurred.

A historical use discussion is also helpful to provide a frame of reference for evaluating reported soil dieldrin (and other chlorinated pesticide) concentrations. Information provided by NAS Memphis states that chlorinated pesticides (primarily chlordane) were previously used until the late 1980's for termite control around buildings. Although chlordane was used as a single active ingredient application, mixtures including dieldrin, aldrin and heptachlor

Discussion of Dieldrin Risk Management Issues

DISCUSSION OF DIELDRIN RISK MANAGEMENT ISSUES

Chlorinated pesticides (specifically dieldrin) were used extensively in the 1950s and 1960s during a white fringed beetle quarantine. NAS Memphis has record that the agents were applied aerially for their intended purpose over the majority of the base. During the RCRA Facility Investigation, dieldrin and other chlorinated pesticides were detected in most surface soil and some vadose soil samples collected at specific SWMUs and background locations. Due to the ubiquitous presence of dieldrin in site soils, the following assessment was performed to support risk management decisions to be made by the BCT.

Figure 1 shows reported surface (0-1 ft.) soil dieldrin concentrations across the northern portion of the base. As shown in the figure, levels at SWMUs ranged from below quantitation limits to 609 $\mu\text{g}/\text{kg}$ (average of duplicate results at SWMU 5, boring 4). At background locations, concentrations ranged from below quantitation limits to 311 $\mu\text{g}/\text{kg}$ with a mean of 131 $\mu\text{g}/\text{kg}$.

In order to provide an evaluation of the significance of the reported levels, standard risk assessment methods were employed. Default assumptions for residential and occupational exposure scenarios were used to project dieldrin-related carcinogenic risk through incidental ingestion and dermal contact soil pathways. For each exposure scenario, risk was computed using the maximum and mean SWMU-specific dieldrin concentrations. The results of this process are provided in the attached table.

As shown in the table, SWMU 5 had the highest projected soil pathway risk associated with dieldrin at maximum concentrations ($2.2\text{E-}5$). The SWMU 5 risk estimate was approximately twice that of the corresponding background. When mean concentrations were used as the exposure point concentration, SWMU 8 dieldrin risk was found to be the highest although it did not differ appreciably from background. In no instance (onsite or background) did dieldrin risk projections exceed $1\text{E-}4$. This finding indicates that dieldrin levels found at each SWMU do not necessitate remedial action in the absence of other significant carcinogenic risk contributors. USEPA's generally acceptable range for carcinogenic risk is $1\text{E-}4$ to $1\text{E-}6$.

Soil dieldrin is not expected to pose a substantial threat to shallow groundwater at any SWMU or background location. This conclusion is based on the strong soil binding properties of the compound as well as empirical data for vadose soils which show no significant vertical migration has occurred.

A historical use discussion is also helpful to provide a frame of reference for evaluating reported soil dieldrin (and other chlorinated pesticide) concentrations. Information provided by NAS Memphis states that chlorinated pesticides (primarily chlordane) were previously used until the late 1980's for termite control around buildings. Although chlordane was used as a single active ingredient application, mixtures including dieldrin, aldrin and heptachlor
